3ITU01 ELECTRONIC DEVICES & CIRCUITS

MAX_MARKS(50+100)

Objectives:

To acquaint the students with construction, theory and characteristics of the following electronic devices:

1. p-n junction diode
2. Bipolar transistor
3. Field effect transistor
4. LED, LCD and other photo electronic devices
5. Power control / regulator devices

Syllabus:

Mobility and conductivity, charge densities in a semiconductor, Fermi Dirac distribution,carrier concentrations and fermi levels in semiconductor, Generation and recombination of charges, diffusion and continuity equation, Mass action Law, Hall effect, Junction diodes, Diode as a ckt. element, load line concept, clipping and clamping circuits, Voltage multipliers.

Transistor characteristics, Current components, Current gains: alpha and beta. Operating point. Hybrid model, h-parameter equivalent circuits. CE, CB and CC configuration. DC and AC analysis of CE,CC and CB amplifiers. Ebers-Moll model. Biasing & stabilization techniques. Thermal runaway, Thermal stability.

SMALL SIGNAL AMPLIFIERS AT LOW FREQUENCY : Analysis of BJT and FET, RC coupled amplifiers. Frequency response, midband gain, gains at low and high frequency. Miller's Theorem. Cascading Transistor amplifiers, Emitter follower. JFET, MOSFET, Equivalent circuits and biasing of JFET's & MOSFET's. Low frequency CS and CD JFET amplifiers. FET as a voltage variable resistor. Source follower.

FEEDBACK AMPLIFIERS : Classification, Feedback concept, Transfer gain with feedback, General characteristics of negative feedback amplifiers. Analysis of voltageseries, voltage-shunt, current- series and current-shunt feedback amplifier. Stability criterion.

OSCILLATORS : Classification. Criterion for oscillation. Tuned collector, Hartley, Colpitts, RC Phase shift, Wien bridge and crystal oscillators, Astable, monostable and bistable multivibrators. Schmitt trigger.

Text/References:
1. Electronic devices & circuits theory By R.L. Boylestad, Louis Nashelsky ,Pearson education
2. Integrated Electronics By Millman Halkias, T.M.H
3. Electronic devices & circuits By David Bell, Oxford Publications

Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

3ITU02 DATA STRUCTURES & ALGORITHMS

MAX_MARKS(50+100)

Objectives:

1. To study various data structure concepts like Stacks, Queues, Linked List, Trees and Files.
2. To overview the applications of data structures.
3. To be familiar with utilization of data structure techniques in problem solving.
4. To have a comprehensive knowledge of data structures and relevant algorithms.
5. To carry out asymptotic analysis of any algorithm

Syllabus:

Asymptotic notations: Concept of complexity of program, Big-Oh, theta, Omega- Definitions and examples, Determination of time and space complexity of simple algorithms without recursion. Representing a function in asymptotic notations viz $5n^2-6n=\theta(n^2)$

Linear Data Structures: Array as storage element, Row major & column major form of arrays, computation of address of elements of n dimensional array. Arrays as storage elements for representing polynomial of one or more degrees for addition & multiplication, sparse matrices for transposing & multiplication, stack, queue, dequeue, circular queue for insertion and deletion with condition for over and underflow, transposition of sparse matrices with algorithms of varying complexity (Includes algorithms for operations as mentioned).

Evaluation of Expression: Concept of precedence and associativity in expressions, difficulties in dealing with infix expressions, Resolving precedence of operators and association of operands, postfix & prefix expressions, conversion of expression from one form to other form using stack (with & without parenthesis), Evaluation of expression in infix, postfix & prefix forms using stack. Recursion.

Linear linked lists: singly, doubly and circularly connected linear linked lists- insertion, deletion at/ from beginning and any point in ordered or unordered lists. Comparison of arrays and linked lists as data structures.

Linked implementation of stack, queue and dequeue. Algorithms for of insertion, deletion and traversal of stack, queue, dequeue implemented using linked structures. Polynomial representation using linked lists for addition, Concepts of Head Node in linked lists.

Searching: Sequential and binary search

Scheme Code – 2015IT

Sorting: Insertion, quick, heap, topological and bubble sorting algorithms for different characteristics of input data. Comparison of sorting algorithms in term of time complexity.

Non-Linear Structures: Trees definition, characteristics concept of child, sibling, parent child relationship etc, binary tree: different types of binary trees based on distribution of nodes, binary tree (threaded and unthreaded) as data structure, insertion, deletion and traversal of binary trees, constructing binary tree from traversal results. Threaded binary Tree.Time complexity of insertion, deletion and traversal in threaded and ordinary binary trees. AVL tree: Concept of balanced trees, balance factor in AVL trees, insertion into and deletion from AVL tree, balancing AVL tree after insertion and deletion. Application of trees for representation of sets.Operations on Weight Balanced Trees, 2-3-4 Trees.

Graphs: Definition, Relation between tree & graph, directed and undirected graph, representation of graphs using adjacency matrix and list. Depth first and breadth first traversal of graphs, finding connected components and spanning tree.Single source single destination shortest path algorithms. Definitions of Isomorphic Components.Circuits,Fundamental Circuits,Cut-sets.Cut-Vertices, PlanerandDualgraphs, SpanningTrees,Kuratovski'stwoGraphs.

NOTE:

1. Algorithm for any operation mentioned with a data structure or required to implement the particular data structure is included in the curriculum.

TEXT BOOK
1. Data Structures in C/C++, Tanenbaum, Pearson
2. Data Structure and Algorithms, Pai TMGH

REFERENCE BOOKS
1. An introduction to data structures with applications By Jean-Paul Tremblay, P. G. Sorenson, TMH
2. Data Structures in C/C++, Horowitz, Sawhney, Galgotia
3. Data Structures in C++, Weiss, Parson

Scheme Code – 2015IT

3ITU03 DIGITAL ELECTRONICS

MAX_MARKS(50+100)

Objectives:

1. To identify various number systems and work with Boolean Algebra.
2. To understand various logic gates and their technologies
3. To understand the working of combinational circuits and learn their design concepts.
4. To learn working of various types of flip flops used for designing registers and counters and other sequential circuits.
5. To learn equivalence of a circuit design and Boolean algebra and use it to optimize the design

Syllabus:

Number Systems, Basic Logic Gates &Boolean Algebra: Binary Arithmetic & Radix representation of different numbers. Sign & magnitude representation, Fixed point representation, complement notation, various codes & arithmetic in different codes & their inter conversion. Features of logic algebra, postulates of Boolean algebra.Theorems of Boolean algebra.Boolean function.

Derived logic gates: Exclusive-OR, NAND, NOR gates, their block diagrams and truth tables. Logic diagrams from Boolean expressions and vica-versa. Converting logic diagrams to universal logic. Positive, negative and mixed logic.Logic gate conversion.

Minimization Techniques: Minterm, Maxterm, Karnaugh Map, K map upto 4 variables. Simplification of logic functions with K-map, conversion of truth tables in POS and SOP form. Incomplete specified functions. Variable mapping.Quinn-McKlusky minimization techniques.

Combinational Systems: Combinational logic circuit design, half and full adder, subtractor. Binary serial and parallel adders.BCD adder.Binary multiplier. Decoder: Binary to Gray decoder, BCD to decimal, BCD to 7-segment decoder. Multiplexer, demultiplexer, encoder.Octal to binary, BCD to excess-3 encoder.Diode switching matrix.Design of logic circuits by multiplexers, encoders, decoders and demultiplexers.

Sequential Systems: Latches, flip-flops, R-S, D, J-K, Master Slave flip flops. Conversions of flip-flops. Counters: Asynchronous (ripple), synchronous andsynchronous decade counter, Modulus counter, skipping state counter, counter design. Ring counter. Counter applications. Registers: buffer register, shift register.

TEXT BOOKS
1. Digital Logic and Computer Design By M. Morris Mano, Pearson.
2. Digital circuit design By S. Salivahanan, Sarivazhagan, Vikas publications.

3ITU04 SOFTWARE ENGINEERING

MAX_MARKS(50+100)

OBJECTIVE-

1. Comprehend software development life cycle.
2. Prepare SRS document for a project
3. Apply software design and development techniques.
4. Identify verification and validation methods in a software engineering project.
5. Implement testing methods at each phase of SDLC.
6. Analyze and Apply project management techniques for a case study

Syllabus:-

Introduction - Evolving role of software, Software a crisis on the Horizon, Software Myths Software engineering layered technology

Software process & Software process models , The linear sequential model ,The prototyping model ,The RAID model , Evolutionary models , Component based development , The formal methods model , Fourth generation techniques

Project management concepts, Software Process and project metrics, Software project planning, Software project estimation, Risk management, RMMM plans

Project scheduling and tracking, Software quality assurance, Software configuration management,

Requirement analysis-software prototyping-Specification Review Analysis modeling, Data modeling-functional modeling

Behavioral modeling- Data dictionary Design concepts and principles, Effective modular design, design heuristics, Design model, Documentation

Software design-Software architecture, Data designing, Architectural styles, Transform mapping, Transaction mapping, Refining architectural design User interface design, Component level design

Software testing techniques-White box and black box testing, Unit testing, integrating testing, validation technique, System testing - debugging

TEXT BOOKS
1. Software Engineering By Roger S. Pressman, TMH
2. Software Engineering By Ian Sommerville

REFERENCE BOOKS
1. Software Engineering Fundamental By Ali Behforooz, Frederick J Hudson, Oxford University Press
2. Software Engineering Concepts By **Richard E. Fairley** (Mcgraw-Hill)

Scheme Code – 2015IT

3ITU05 OBJECT ORIENTED PROGRAMMING

MAX_MARKS(50+100)

Objective : The objective of this course is to provide knowledge about programming basics that might be useful to B.Tech. Computer Science and Information Technology student, in more practical manner. These programming skills often occur in practical engineering problem of Computer Science student.

Syllabus

Introduction: Review of structures in C, accessing members of structures using structure variables, pointer to structures, passing structures to functions, structures as user defined data types.

Introduction to programming paradigms- (Process oriented and Object oriented). Concept of object, class, objects as variables of class data type, difference in structures and class in terms of access to members, private and public Basics of C++: Structure of C++ programs, introduction to defining member functions within and outside a class, keyword using, declaring class, creating objects, constructors & destructor functions, Initializing member values with and without use of constructors, simple programs to access & manipulate data members, cin and cout functions. Dangers of returning reference to a private data member, constant objects and members function, composition of classes, friend functions and classes, using this pointer, creating and destroying objects dynamically using newand deleteoperators.

Static class members, members of a class, data & function members. Characteristics of OOP-Data hiding, Encapsulation, data security.

Operator overloading: Fundamentals, Restrictions, operator functions as class members v/s as friend functions. Overloading stream function, binary operators and unary operators.

Inheritance: Base classes and derived classes, protected members, relationship between base class and derived classes, constructors and destructors in derived classes, public, private and protected inheritance, relationship among objects in an inheritance hierarchy, abstract classes, virtual functions and dynamic binding, virtual destructors.

Multiple inheritance, virtual base classes, pointers to classes and class members, multiple class members. Templates, exception handling.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19

Text/References:

1. How to Program C++, Dietel, Pearson

2. Mastering C++ By K.R.Venugopal, TMH

3. Object Oriented Programming in C++ By Robert Lafore, Pearson

4. Object Oriented Design & Modelling, Rambaugh, Pearson

Scheme Code – 2015IT

3ITU06 ADVANCED ENGINEERING MATHEMATICS

MAX_MARKS(50+100)

Objective: The objective of this course is to provide tools of Mathematics that might useful in B. Tech. Computer Science and Information Technology students in more practical manner. This course is meant to provide grounding in Statistics, Transform and Numerical Techniques that can be applied in modeling processes and decision making. These techniques often occur in practical engineering problems of computer science students.

Syllabus:

Random Variables: Discrete and Continuous random variables, Joint distribution, Probability distribution function, conditional distribution.

Mathematical Expectations: Moments, Moment Generating Functions, variance and correlation coefficients, Chebyshev's Inequality, Skewness and Kurtosis.

Binomial distribution, Normal Distribution, Poisson Distribution and their relations, Uniform Distribution, Exponential Distribution.

Correlation: Karl Pearson's coefficient, Rank correlation. Curve fitting. Line of Regression.

Laplace Transform: Definition and existence of Laplace Transform, Properties and Formulae, Unit Step Function, Dirac Delta Function, Heaviside Function, Inverse Laplace Transform, Convolution theorem, Application of Laplace Transform to Ordinary Differential Equation, Solution of Integral Equations.

Interpolation: Difference Operators- Forward, Backward, Central, Shift and Average Operators, Newton's and Gauss's forward and backward interpolation formulae for equal intervals, Stirling's Formula, Lagrange Interpolation Formula, Inverse Interpolation.

Numerical Differentiation by Newton's, Gauss's and Stirling's Formula.

Numerical Integration: Trapezoidal Rule, Simpson's 1/3 and 3/8 Rule.

Numerical Solution of ODE of First Order: Picard's method, Euler's method, Modified Euler's method, Runge-Kutta method forth order method, Milne's Method.

Scheme Code – 2015IT

3ITU07 ELECTRONIC DEVICES AND CIRCUITS LAB

MAX_MARKS(50+25)

Objectives:

1. Understand the nature and scope of modern electronics.
2. Describe physical models of basic components.
3. Design and construct simple electronic circuits to accomplish a specific function, e.g., designing amplifiers, ADC converters etc.
4. Understand their capabilities and limitations and make decisions regarding their best utilization in a specific situation.

List of Experiments

1 Plot V-I characteristic of P-N junction diode & calculate cut-in voltage, reverse Saturation current and static & dynamic resistances.

2 Plot V-I characteristic of zener diode and study of zener diode as voltage regulator. Observe the effect of load changes and determine load limits of the voltage regulator.

3 Plot frequency response curve for single stage amplifier and to determine gain bandwidth product.

4 Plot drain current - drain voltage and drain current – gate bias characteristics of field effect transistor and measure of Idss & Vp

5 Application of Diode as clipper & clamper

6 Plot gain- frequency characteristic of two stages RC coupled amplifier & calculate its bandwidth and compare it with theoretical value.

7 Plot gain- frequency characteristic of emitter follower & find out its input and output resistances.

8 Plot input and output characteristics of BJT in CB, CC and CE configurations. Find their h-parameters.

9 Plot gain-frequency characteristics of BJT amplifier with and without negative feedback in the emitter circuit and determine bandwidths, gain bandwidth products and gains at 1kHz with and without negative feedback.

10 Plot and study the characteristics of small signal amplifier using FET.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

11 Study Wein bridge oscillator and observe the effect of variation in R & C on oscillator frequency

12 Study transistor phase shift oscillator and observe the effect of variation in R & C on oscillator frequency and compare with theoretical value.

13 To plot the characteristics of UJT and UJT as relaxation.

14 To plot the characteristics of MOSFET and CMOS.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

Scheme Code – 2015IT

3ITU08 DATA STRUCTURES AND ALGORITHM LAB

MAX_MARKS(50+25)

Objectives:

1. To implement concepts of linear data structures like Stack and Queue.
2. To implement various Sorting and Searching Techniques.
3. To learn programming same problems using both arrays and pointers.
4. To implement concepts of non-linear data structures

List of Experiments:

1. Write a simple C program on a 32 bit compiler to understand the concept of array storage, size of a word. The program shall be written illustrating the concept of row major and column major storage. Find the address of element and verify it with the theoretical value. Program may be written for arrays upto 4-dimensions.

2. Simulate a stack, queue, circular queue and dequeue using a one dimensional array as storage element. The program should implement the basic addition, deletion and traversal operations.

3. Represent a 2-variable polynomial using array. Use this representation to implement addition of polynomials.

4. Represent a sparse matrix using array. Implement addition and transposition operations using the representation.

5. Implement singly, doubly and circularly connected linked lists illustrating operations like addition at different locations, deletion from specified locations and traversal.

6. Repeat exercises 2, 3 & 4 with linked structure.

7. Implementation of binary tree with operations like addition, deletion, traversal.

8. Depth first and breadth first traversal of graphs represented using adjacency matrix and list.

9. Implementation of binary search in arrays and on linked Binary Search Tree.

10. Implementation of insertion, quick, heap, topological and bubble sorting algorithms.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

3ITU09 DIGITAL ELECTRONICS LAB

MAX_MARKS(50+25)

Objectives:

1. Understand electrical conduction in solid state materials
2. Analyze and design dc and switching circuits containing diodes and transistors
3. Analyze and design combinational logic circuits at the transistor level
4. Develop skill with computer-based circuit simulation

List of Experiments

1. To verify the truth tables of basic logic gates: AND, OR, NOR, NAND, NOR.Also to verify the truth table of Ex-OR, Ex-NOR (For 2, 3, & 4 inputs using gates with 2, 3, & 4 inputs).

2 To verify the truth table of OR, AND, NOR, Ex-OR, Ex-NOR realized using NAND & NOR gates.

3 To realize an SOP and POS expression.

4 To realize Half adder/ Subtractor & Full Adder/ Subtractor using NAND & NOR gatesand to verify their truth tables.

5 To realize a 4-bit ripple adder/ Subtractor using basic Half adder/ Subtractor &basic Full Adder/ Subtractor.

6 To verify the truth table of 4-to-1 multiplexer and 1-to-4 demultiplexer. Realize themultiplexer using basic gates only. Also to construct and 8-to-1 multiplexer and 1-to-8demultiplexer using blocks of 4-to-1 multiplexer and 1-to-4 demultiplexer

7 Design & Realize a combinational circuit that will accept a 2421 BCD code and drive a TIL - 312 seven-segment display.

8 Using basic logic gates, realize the R-S, J-K and D-flip flops with and without clocksignal and verify their truth table

9 Construct a divide by 2,4 & 8 asynchronous counter. Construct a 4-bit binary counter and ring counter for a particular output pattern using D flip flop.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

10 Perform input/output operations on parallel in/Parallel out and Serial in/Serial outregisters using clock. Also exercise loading only one of multiple values into theregister using multiplexer.

Note: As far as possible, the experiments shall be performed on bread board.
However, experiment Nos. 1-4 are to be performed on bread board only.

Scheme Code – 2015IT

3ITU10 OBJECT ORIENTED PROGRAMMINGLAB

MAX_MARKS(50+25)

Objective: The objective of this course is to provide knowledge about programming basics that might be useful to B.Tech. Computer Science and Information Technology student, in more practical manner. These programming skills often occur in practical engineering problem of Computer Science student.

Syllabus:

1. To write a simple program for understanding of C++ program structure without any CLASS declaration. Program may be based on simple input output, understanding of keyword using.

1. Write a C++ program to demonstrate concept of declaration of class with public & private member, constructors, object creation using constructors, access restrictions, defining member functions within and outside a class. Scope resolution operators,
accessing an object's data members and functions through different type of object handle name of object, reference to object, pointer to object, assigning class objects to each other.

2. Program involving multiple classes (without inheritance) to accomplish a task. Demonstrate composition of class.

3. Demonstration Friend function friend classes.

4. Demonstration dynamic memory management using new &delete & static class members.

5. Demonstration of restrictions an operator overloading, operator functions as member function and/ or friend function, overloading stream insertion and stream extraction, operators, overloading operators etc.

6. Demonstrator use of protected members, public & private protected classes, multi-level inheritance etc.

7. Demonstration of exception handling.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19

4ITU01 MICROPROCESSOR AND INTERFACES

M.M(50+100)

Objective: The objective of this course is to provide a theoretical & practical introduction to microcontrollers and microprocessors, assembly language programming techniques, design of hardware interfacing circuit, microcontroller and microprocessor system design considerations.

Syllabus:

Introduction to Microprocessors, microcontroller; 8085 Microprocessor Architecture, pin description, Bus concept and organization; concept of multiplexing and de-multiplexing of buses; concept of static and dynamic RAM, type of ROM, memory map.

Software architecture registers and signals, Classification of instruction, Instruction set, addressing modes, Assembly Language Programming and Debugging, Programming Technique, instruction Format and timing.

Advance Assembly Language Programming, Counter and time delay; types of Interrupt and their uses, RST instructions and their uses, 8259 programmable interrupt controller; Macros, subroutine; Stack- implementation and uses with examples; Memory interfacing.

8085 Microprocessor interfacing:, 8255 Programmable Peripheral Interface, 8254 programmable interval timer, interfacing of Input/output device, 8279 Key board/Display interface.

Microprocessor Application: Interfacing scanned multiplexed display and liquid crystal display, Interfacing and Matrix Keyboard, MPU Design; USART 8251, RS232C and RS422A, Parallel interface- Centronics and IEEE 488.

TEXT BOOK
1. Microprocessor architecture, programming, and applications with the 8085 By Ramesh S. Gaonkar

REFERENCE BOOKS
1. Introduction to Microprocessor By Aditya P. Mathur, TMH
2. Microprocessor &Interfaceing By Douglas V. Hall, TMH
3. Microprocessor & Peripheral By A.K.Ray, K.M. Bhurchandi, TMH

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

4ITU02 DISCRETE MATHEMATICS STRUCTURE

M.M(50+100)

Objectives:

- Some fundamental mathematical concepts and terminology;
- How to use and analyze recursive definitions;
- How to count some different types of discrete structures;
- Techniques for constructing mathematical proofs, illustrated by discrete mathematics examples.

Set Theory: Definition and types, Set operations, Partition of set, Cardinality (Inclusion-Exclusion & Addition Principles).

Relations: Definition, Binary Relation, Matrix of Relation, Digraph of Relation, Properties of Relations, Equivalence relations and partition, Equivalence Class, The Connectivity Relations, Operations on Relations, Closures of Relation, Transitive Closure-Warshall's Algorithm.

Functions: Concept, Some Special Functions (Characteristic, Floor & CeilingFunctions), Properties of Functions, The Pigeonhole &Generalized Pigeonhole Principles, Composition of Functions.

Language of Logic: Proposition, Compound Proposition, Conjunction, Disjunction, Implication, Converse, Inverse &Contrpositive, Biconditional Statements, tautology, Contradiction & Contingency, Logical Equivalences, Quantifiers, Arguments.

Methods of Proof: Direct, Indirect, Principle of Mathematical Induction.

Graph Theory: Graphs- Directed, Undirected, Simple, Adjacency & Incidence, Degree of Vertex, Subgraph, Complete graph, Cycle & Wheel Graph, Bipartite & Complete Bipartite Graph, Weighed Graph, Complete Graphs, Isomorphic Graphs, Path, Cycles & Circuits Euclerian& Hamiltonian Graphs.

Trees: Definition, Spanning Trees, Minimal Spanning Trees,Prim's Algo, Kruskal'sAlgo.

Text books:

1. Discrete Mathematical Analysis, Kolman et al., Pearson
2. Discrete Mathematics and its Applications, Kenneth H. Rosen, MGH
Reference books:

2.   Discrete Mathematics with Applications, Koshy, ELSEVIER

Scheme Code – 2015IT

4ITU03 LINUX AND SHELL PROGRAMMING

M.M(50+100)

Objective: The objective of this course is to introduce Unix/Linux kernel programming techniques that useful in B.Tech.Computer science and Information Technology students in more practical manner.This course also provide the knowledge of shell scripting and Linux tools and applications.

Syllabus:

Introduction/: Logging in, changing password (*passwd* command only), *man, xman, info* commands to access on line help. Simple commands like *ls, cp, mv, grep, head, tail, sort, uniq, diff, echo, date, which, whereis, whatis, who, finger w* (option and variations included).

Directory commands, access permissions, changing access permissions for files and directories, hard & symbolic links.Environment and path setting.

vi editor: Creating and editing files, features of vi, insertion deletion, searching, substitution operations, yank, put, delete commands, reading & writing files, *exrc* file for setting parameters, advance editing techniques. Vim (improved vi).

Programming utilities: Compiling & linking C, C++ programs, *make* utility, debugging C programs using *gdb*, system call.

Introduction to X-window system: x-window as client/ server system, concept of window manager, remote computing & local displays, *xinitrc* file, customize X work environment and applications, customizing the *fvwm* window manager

Shell: Meaning and purpose of shell, Introduction to types of shell. The command line, standard input and standard output, redirection, pipes, filters special characters for searching files and pathnames.

Bourne Again Shell: shell script-writing and executing, command separation & grouping, redirection, directory stack manipulation, processes, parameters & variables, keyword variables.

Shell Programming: Control structures, the *Here* document, expanding *NULL* or *USET* variables, Built-ins, functions, history, aliases, job control, filename substitution. source code management-RCS and CVS. *awk* utility.

4ITU04 ANALYSIS OF ALGORITHMS

M.M(50+100)

Objectives- To teach various problem solving strategies. To teach mathematical background for algorithm analysis and implementation of various strategies like divide and conquer, Greedy method, Dynamic programming, backtracking, branch and bound. To teach different string matching algorithms.

Contents of the subject

BACKGROUND: Review of Algorithm, Complexity Order Notations: definitions and calculating complexity.

DIVIDE AND CONQUER METHOD: Binary Search, Merge Sort, Quick sort and Strassen's matrix multiplication algorithms.

GREEDY METHOD: Knapsack Problem, Job Sequencing, Optimal Merge Patterns and Minimal Spanning Trees.

DYNAMIC PROGRAMMING: Matrix Chain Multiplication. Longest Common

Subsequence and 0/1 Knapsack Problem.

BRANCH AND BOUND: Traveling Salesman Problem and Lower Bound Theory. Backtracking Algorithms and queens problem.

PATTERN MATCHING ALGORITHMS: Naïve and Rabin Karp string matching algorithms, KMP Matcher and Boyer Moore Algorithms.

ASSIGNMENT PROBLEMS: Formulation of Assignment and Quadratic Assignment Problem.

RANDOMIZED ALGORITHMS- Las Vegas algorithms, Monte Carlo algorithms, randomized algorithm for Min-Cut, randomized algorithm for 2- SAT. Problem definition of Multicommodity flow, Flow shop scheduling and Network capacity assignment problems.

NUMBER THEORITIC ALGORITHM: Number theoretic notions, Division theorem, GCD, recursion, Modular arithmetic, Solving Modular Linear equation, Chinese Remainder Theorem, power of an element, Computation of Discrete Logarithms, primality Testing and Integer Factorization.

PROBLEM CLASSES NP, NP-HARD AND NP-COMPLETE: Definitions of P, NP-Hard and NP-Complete Problems. Decision Problems.Cook's Theorem. Proving NP-Complete Problems - Satisfiability problem and Vertex Cover Problem. Approximation Algorithms for Vertex Cover andSet Cover Problem.

4ITU05 PRINCIPLES OF COMMUNICATION

M.M(50+100)

Objectives:

1. To introduce communication and to demonstrate the importance of communication in a variety of contexts including that of the manager of innovation and change.

2. To evaluate and discuss the characteristics of good communication and how to improve our communication.

Contents of the subject

ANALOG MODULATION: Concept of frequency translation. Amplitude Modulation: Description of full AM, DSBSC, SSB and VSB in time and frequency domains, methods of generation & demodulation, frequency division multiplexing (FDM). Angle Modulation: Phase and frequency modulation. Descriptions of FM signal in time and frequency domains, methods of generation & demodulation, pre- emphasis & de-emphasis, PLL.

PULSE ANALOG MODULATION: Ideal sampling, Sampling theorem, aliasing, interpolation, natural and flat top sampling in time and frequency domains. Introduction to PAM, PWM, PPM modulation schemes. Time division multiplexing (TDM)

PCM & DELTA MODULATION SYSTEMS: Uniform and Non-uniform quantization. PCM and delta modulation, Signal to quantization noise ratio in PCM and delta modulation.DPCM, ADM, T1 Carrier System, Matched filter detection.Error probability in PCM system.

DIGITAL MODULATION: Baseband transmission: Line coding (RZ, NRZ), inter symbol interference (ISI), pulse shaping, Nyquist criterion for distortion free base band transmission, raised cosine spectrum. Pass band transmission: Geometric interpretation of signals, orthogonalization. ASK, PSK, FSK, QPSK and MSK modulation techniques, coherent detection and calculation of error probabilities.

SPREAD-SPECTRUM MODULATION: Introduction, Pseudo-Noise sequences, directsequence spread spectrum (DSSS) with coherent BPSK, processing gain, probability of error, frequency-hop spread spectrum (FHSS). Application of spread spectrum: CDMA

4ITU06 COMPUTERNETWORKS

M.M(50+100)

Objective:

1. To make students learn architecture of data communication networks.
2. Build an understanding of the fundamental concepts of computer networking.
3. Explain how communication works in data networks and the Internet.
4. Recognize the different internetworking devices and their functions.
5. Analyze the services and features of the various layers of data networks.
6. Design, calculate, and apply subnet masks and addresses to fulfill networking requirements.
7. Analyze the features and operations of various application layer protocols such as Http, DNS, and SMTP.

Syllabus:

Network Reference Models (OSI/ISO and TCP/IP) Issues and Challenges in Physical Layer.

Data Link Layer: Functions of data link layer and design issues, Flow Control: Flow control in lossless and lossy channels using stop-and-wait, sliding window protocols. Performance of protocols used for flow control.

Error Control Coding: Error Detection, Two Dimensional Parity Checks, and Internet Checksum. Polynomial Codes, Standardized polynomial codes, error detecting capability of a polynomial codes. Linear codes, performance of linear codes, error detection & correction using linear codes, Data Link Control: HDLC & PPP including frame structures.

MAC sub layer: Channel Allocation Problem, Pure and slotted Aloha, CSMA, CSMA/CD, collision free multiple access, Throughput analysis of pure and slotted Aloha, Ethernet Performance.

Network layer-design issue, routing algorithms: Distance vector, link state, hierarchical, Broadcast routing, Congestion control: congestion prevention policies, congestion control in Datagram subnets, load shedding, jitter control, Leaky bucket and token bucket algorithms.

Internetworking: Differences in networks, Tunneling, Internetwork routing, Fragmentation Network layer in the Internet: IPv4 classful and classless addressing, subnetting Network layer protocols(only working and purpose; packet headers etc. not included), Differences in IPV6 over IPV4.

Elements of transport protocols: addressing, connection establishment and release, flow control and buffering, multiplexing and demultiplexing, crash recovery, introduction to UDP protocol, Principles of Reliable Data Transfer

Transport Layer in the Internet: Introduction to TCP, TCP service Model, TCP Header and segment structure, TCP connection establishment and release, transmission policy, timer management, Transactional TCP. Mobile TCP, TCP Congestion Control

4ITU07 MICROPROCESSOR LAB

M.M(50+25)

Objective:

The objective of this lab is to introduce the basics of microprocessor programming, learn use of microprocessor in simple applications. this lab also provide a theoretical & practical introduction to microcontrollers and microprocessors, assembly language programming techniques, design of hardware interfacing circuit, microcontroller and microprocessor system design considerations.

List of Experiments

1 Add the contents of memory locations XX00 &XX01 & place the result in memory location XX02.

2 Add the 16 bit numbers stored in memory location & store the result in another memory location.

3 Transfer a block of data from memory location XX00 to another memory location XX00 in forward & reverse order.

4 Write a program to Swap two blocks of data stored in memory.

5 Write a program to find the square of a number.

6 Write a main program & a conversion subroutine to convert Binary to its equivalent BCD.

7 Write a program to find largest & smallest number from a given array.

8 Write a program to Sort an array in ascending & descending order.

9 Write a program to multiply two 8 bit numbers whose result is 16 bit.

10 Write a program of division of two 8 bit numbers.

11 Generate square wave from SOD pin of 8085 & observe on CRO.

12 Write a program to perform traffic light control operation.

13 Write a program to control the speed ofa motor.

Scheme Code – 2015IT

4ITU08 COMMUNICATION LAB

M.M(50+25)

Objectives:

To understand basic analog and digital communication system theory and design, with an emphasis on wireless communications methods.

List of Experiments

1 Harmonic analysis of a square wave of modulated waveform Observe the amplitude modulated waveform and measures modulation index. Demodulation of the AM signal

2 To modulate a high frequency carrier with sinusoidal signal to obtain FM signal. Demodulation of the FM signal

3 To observe the following in a transmission line demonstrator kit :

i. The propagation of pulse in non-reflecting Transmission line.

ii. The effect of losses in Transmission line.

iii. The resonance characteristics of al half wavelength long x-mission line.

4 To study and observe the operation of a super heterodyne receiver

5 To modulate a pulse carrier with sinusoidal signal to obtain PWM signal and demodulate it.

6 To modulate a pulse carrier with sinusoidal signal to obtain PPM signal and demodulate it.

7 To observe pulse amplitude modulated waveform and its demodulation.

8 To observe the operation of a PCM encoder and decoder. To consider reason for using digital signal x-missions of analog signals.

9 Produce ASK signals, with and without carrier suppression. Examine the different processes required for demodulation in the two cases

10 To observe the FSK wave forms and demodulate the FSK signals based on the properties of (a) tuned circuits (b) on PI.L.

11 To study & observe the amplitude response of automatic gain controller (AGC).

Scheme Code – 2015IT

4ITU09 LINUX SHELL PROGRAMMING LAB

M.M(50+25)

Objective:

The objective of this lab is to learn Unix/Linux Shell commands, file and directory structure of Unix file system. This lab also introduces the fundamentals of shell scripting/programming. Students will be able to use Linux environment efficiently and solve problems using bash for shell scripting.

List of Experiments

2. Use of Basic Unix Shell Commands: ls, mkdir, rmdir, cd, cat, banner, touch, file, wc, sort, cut, grep, dd, dfspace, du, ulimit.

3. Commands related to inode, I/O redirection and piping, process control commands, mails.

4. Shell Programming: Shell script exercises based on following

   (i) Interactive shell scripts (ii) Positional parameters (iii) Arithmetic

   (iv) if-then-fi, if-then-else-fi, nested if-else (v) Logical operators

   (vi) else + if equals elif, case structure (vii) while, until, for loops, use of break

   (viii) Metacharacters (ix) System administration: disk management and daily administration

5. Write a shell script to create a file in $USER /class/batch directory. Follow the instructions

   (i) Input a page profile to yourself, copy it into other existing file;

   (ii) Start printing file at certain line

   (iii) Print all the difference between two file, copy the two files at $USER/CSC/2007 directory.

   (iv) Print lines matching certain word pattern.

6. Write shell script for-

   (i) Showing the count of users logged in,

   (ii) Printing Column list of files in your home directory

   (iii) Listing your job with below normal priority

   (iv) Continue running your job after logging out.

7. Write a shell script to change data format .Show the time taken in execution of this script

8. Write a shell script to print files names in a directory showing date of creation & serial number of the file.

9. Write a shell script to count lines, words and characters in its input (do not use wc).

10. Write a shell script to print end of a Glossary file in reverse order using Array. (Use awk tail)

11. Write a shell script to check whether Ram logged in, Continue checking further after every 30 seconds till success.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

4ITU010 ADVANCE DATA STRUCTURE LAB

M.M(50+25)

Objectives: Upon successful completion of this course, students should be able to:

1. Prove the correctness and analyze the running time of the basic algorithmsfor those classic problems in various domains;

2. Apply the algorithms and design techniques to solve problems;

3. Analyze the complexities of various problems in different domains.

Suggested Tools: For implementation and estimation of running time on various sizes

of input(s) or output(s) as the case may be, Linux platform is suggested.

EXERCISES:

A. It is expected that teachers will assign algorithms to the students for estimation of time & space complexity. Algorithms reported in various research journals may be chosen by the teachers.

B. Problem on designing algorithms to meet complexity constraints may beassigned. For example, a problem on design, analysis and implementation for transposing a sparse matrix requiring not more than one pass from the original matrix may be assigned.

6.   A guide to such problems is given below:

2.   Exploring a Binary Heap: Consider a binary heap containing n numbers (the root stores the greatest number). You are given a positive integer k < n and a number x. You have to determine whether the k th largest element of the heap is greater than x or not. Your algorithm must take O(k) time. You may use O(k) extra storage.

   Merging two search trees: You are given two height balanced binary search trees T and T', storing m and n elements respectively. Every element of tree T is smaller than every element of tree T'. Every node u also stores height of the subtree rooted at it. Using this extra information how can you merge the two trees in time O(log m + log n) (preserving both the height balance and the order)?

3. Complete binary tree as an efficient data-structure:

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

You are given an array of size n (n being a power of two). All the entries of the array are initialized to zero. You have to perform a sequence of the following online operations :

1. (i) Add(i,x) which adds x to the entry A[i].

2. (ii) Report sum(i,j) = sum of the entries in the array from indices i to j for any $0 < i < j <= n$.

It can be seen easily that we can perform the first operation in O(1) time whereas the second operation may cost O(n) in worst case. Your objective is to perform these operations efficiently. Give a data- structure which will guarantee O(log n) time per operation.

4. Problems on Amortized Analysis

    a. Delete-min in constant time!!! Consider a binary heap of size n, the root storing the smallest element. We know that the cost of insertion of an element in the heap is O(log n) and the cost of deleting the smallest element is also O(log n). Suggest a valid potential function so that the amortized cost of insertion is O(logn) whereas amortized cost of deleting the smallest element is O(1).

    b. Implementing a queue by two stack

4.   Show how to implement a queue with two ordinary stacks so that the amortized cost of each Enqueue and each Dequeue operation is O(1).

6.   Computing a spanning tree having smallest value of largest edge weight: Describe an efficient algorithm that, given an undirected graph G, determines a spanning tree of G whose largest edge weight is minimum over all spanning trees of G.

3.   Shortest Path Problems:

    i.   From a subset of vertices to another subset of vertices

a. Given a directed graph G(V,E), where edges have nonnegative weights. S and D are two disjoint subsets of the set of vertices. Give an O(|V| log |V| + |E|) time algorithm to find the shortest path among the set of paths possible from any node in S to any node in D.

7.   Paths in Directed Acyclic Graph

a. Counting the number of paths Given two nodes u,v in a directed acyclic graph G(V,E). Give an O(|E|) time algorithm to count all the paths from u to v.

b. Path passing through a subset of nodesGiven two nodes u,v and a set of vertices w 1 , w 2 ,...,w k in a directed acyclic graph G(V,E). Give an O(|E|) time algorithm to output a path(if

Scheme Code – 2015IT

exists) from u to v which passes through each of the nodes w 1 ,...,w k . If there is no such path then your algorithm must report that "no such path exists".

7. Searching for a friend: You are standing at a crossing from where there emerge four roads extending to infinity. Your friend is somewhere on one of the four roads. You do not know on which road he is and how far he is from you. You have to walk to your friend and the total distance traveled by you must be at most a constant times the actual distance of your friend from you. In

terminology of algorithms, you should traverse O(d) distance, where d is the distance of your friend from you.

8. A simple problem on sorted array: Design an O(n)-time algorithm that, given a real number x and a sorted array S of n numbers, determines whether or not there exist two elements in S whose sum is exactly x .

9. Finding the decimal dominant in linear time: You are given n real numbers in an array. A number in the array is called a decimal dominant if it occurs more than n/10 times in the array. Give an O(n) time algorithm to determine if the given array has a decimal dominant.

3. Finding the first one: You are given an array of infinite length containing zeros followed by ones. How fast can you locate the first one in the array?

11. Searching for the Celebrity: Celebrity is a person whom everybody knows but he knows nobody. You have gone to a party. There are total n persons in the party. Your job is to find the celebrity in the party. You can ask questions of the form Does Mr. X know Mr. Y ?. You will get a binary answer for each such question asked. Find the celebrity by asking only O(n) questions

12. Checking the Scorpion: An n-vertex graph is a scorpion if it has a vertex of degree 1(the sting) connected to a vertex of degree two (the tail) connected to a vertex of degree n-2 (the body) connected to the other n-3 (the feet). Some of the feet may be connected to other feet. Design an algorithm that decides whether a given adjacency matrix represents a scorpion by examining only O(n) entries.

Scheme Code – 2015IT
13. Endless list: You are having a pointer to the head of singly linked list. The list either terminates at null pointer or it loops back to some previous location(not necessarily to the head of the list). You have to determine whether the list loops back or ends at a null location in time proportional to the length of the list. You can use at most a constant amount of extra storage.

14. Nearest Common Ancestor: Given a rooted tree of size n. You receive a series of online queries:

"Give nearest common ancestor of u, v ". Your objective is to preprocess the tree in O(n) time to get a data structure of size O(n) so that you can answer any such query in O(log n) time.

5ITU01 Database Management System

M.M(50+100)

Introduction to database systems: Overview and History of DBMS. File System v/s DBMS .Advantage of DBMS Describing and Storing Data in a DBMS. Queries in DBMS. Structure of a DBMS.

Entity Relationship model: Overview of Data Design Entities, Attributes and Entity Sets, Relationship and Relationship Sets. Features of the ER Model- Key Constraints, Participation Constraints, Weak Entities, Class Hierarchies, Aggregation, Conceptual Data Base, and Design with ER Model- Entity v/s Attribute, Entity vs Relationship Binary vs Ternary Relationship and Aggregation v/s ternary Relationship Conceptual Design for a Large Enterprise.

Relationship Algebra and Calculus: Relationship Algebra Selection and Projection, Set Operations, Renaming, Joints, Division, Relation Calculus, Expressive Power of Algebra and Calculus.

SQL queries programming and Triggers: The Forms of a Basic SQL Query, Union, and Intersection and Except, Nested Queries, Correlated Nested Queries, Set-Comparison Operations, Aggregate Operators, Null Values and Embedded SQL, Dynamic SQL, ODBC and JDBC, Triggers and Active Databases.

Schema refinement and Normal forms: Introductions to Schema Refinement, Functional Dependencies, Boyce-Codd Normal Forms, Third Normal Form, Normalization-Decomposition into BCNF Decomposition into 3-NF.

Transaction Processing: Introduction-Transaction State, Transaction properties, Concurrent Executions. Need of Serializability, Conflict vs. View Serializability, Testing for Serializability, Recoverable Schedules, Cascadeless Schedules.

Concurrency Control: Implementation of Concurrency: Lock-based protocols, Timestamp-based protocols, Validation-based protocols, Deadlock handling,

Scheme Code – 2015IT

5ITU02 Operating System

M.M(50+100)

Introduction and need of operating system, layered architecture/logical structure of operating system, Type of OS, operating system as resource manager and virtual machine, OS services, BIOS, System Calls/Monitor Calls, Firmware- BIOS, Boot Strap Loader.

Process management- Process model, creation, termination, states & transitions, hierarchy, context switching, process implementation, process control block, Basic System calls- Linux & Windows. Threads- processes versus threads, threading, concepts, models, kernel & user level threads, thread usage, benefits, multithreading models.

Interprocess communication- Introduction to message passing, Race condition, critical section problem, mutual exclusion with busy waiting- disabling interrupts, lock variables, strict alteration, Peterson's solution, TSL instructions, busy waiting, sleep and wakeup calls, semaphore, monitors, classical IPC problems.

Process scheduling- Basic concepts, classification, CPU and I/O bound, CPU scheduler- short, medium, long-term, dispatcher, scheduling:- preemptive and non-preemptive, Static and Dynamic Priority, Co-operative & Non-cooperative, Criteria/Goals/Performance Metrics, scheduling algorithms- FCFS, SJFS, shortest remaining time, Round robin, Priority scheduling, multilevel queue scheduling, multilevel feedback queue scheduling, Fair share scheduling.

Deadlock- System model, resource types, deadlock problem, deadlock characterization, methods for deadlock handling, deadlock prevention, deadlock avoidance, deadlock detection, recovery from deadlock.

Memory management- concepts, functions, logical and physical address space, address binding, degree of multiprogramming, swapping, static & dynamic loading- creating a load module, loading, static & dynamic linking, shared libraries, memory allocation schemes- first fit, next fit, best fit, worst fit, quick fit. Free space management- bitmap, link list/free list, buddy's system, memory protection and sharing, relocation and address translation.

Scheme Code – 2015IT

5ITU03 THEORY OF COMPUTATION

M.M(50+100)

Objectives:

1. **Understand various computing models like Finite State Machine, Pushdown Automata and Turing machine.**
2. **Be aware of Decidability and undesirability of various problems.**
3. **Familiar with types of grammars.**

Syllabus:

Finite Automata & Regular Expression: Basic Concepts of finite state system, Deterministic and non-deterministic finite automation and designing regular expressions, relationship between regular expression & Finite automata minimization of finite automation mealy & Moore Machines.

Regular Sets of Regular Grammars: Basic Definition of Formal Language and Grammars. Regular Sets and Regular Grammars, closure proportion of regular sets, Pumping lemma for regular sets, decision Algorithms for regular sets.

Context Free Languages& Pushdown Automata: Context Free Grammars – Derivations and Languages – Relationship between derivation and derivation trees, ambiguity ,simplification of CEG – Greibach Normal form – Chomsky normal forms – Problems related to CNF and GNF Pushdown Automata: Definitions ,Moves ,Deterministic pushdown automata ,Pushdown automata and CFL , pumping lemma for CFL -Applications of pumping Lemma.

Turing Machines: Turing machines – Computable Languages and functions , Turing Machine constructions ,Storage in finite control , checking of symbols, subroutines ,two way infinite tape. Undecidability: Properties of recursive and Recursively enumerable languages, Universal Turing Machines as an undecidable problem , Universal Languages – Rice's Theorems.

Linear bounded Automata Context Sensitive Language: Chomsky Hierarchy of Languages and automata, Basic Definition & descriptions of Theory & Organization of Linear bounded Automata Properties of context-sensitive languages.

5ITU04 Computer Architecture and Organization

M.M(50+100)

Objective: The objective of this course is to become familiar in how computer systems work and its basic principles, how to analyze the system performance, concepts behind advanced pipelining techniques, the current state of art in memory system design, how I/O devices are being accessed and its principles to provide the knowledge on instruction Level Parallelism.

Syllabus:

Introduction to Computer Architecture and Organization. Von Neuman Architecture, Flynn Classification.

Register Transfer and Micro operations: Register transfer language, Arithmetic Micro-operations, Logic Micro-operations, Shift Micro-operations, Bus and memory transfers.

Computer Organization and Design: Instruction cycle, computer registers, common bus system, computer instructions, addressing modes, design of a basic computer.

Central Processing Unit: General register organization, stack organization, Instruction formats, Data transfer and manipulation, program control. RISC, CISC characteristics.

Pipeline and Vector processing: Pipeline structure, speedup, efficiency, throughput and bottlenecks. Arithmetic pipeline and Instruction pipeline.

Computer Arithmetic: Adder, Ripple carry Adder, carry look Ahead Adder, Multiplication: Add and Shift, Array multiplier and Booth Multiplier, Division: restoring and Non-restoring Techniques. Floating Point Arithmetic: Floating point representation, Add, Subtract, Multiplication, Division.

Memory Organization: RAM, ROM, Memory Hierarchy, Organization, Associative memory, Cache memory, and Virtual memory: Paging and Segmentation.

Input-Output Organization: Input-Output Interface, Modes of Transfer, Priority Interrupt, DMA, IOP processor.

TEXT / REFERENCE BOOKS
1. Computer Organization and Architecture - William Stallings (Pearson Education Asia)

Scheme Code – 2015IT

5ITU05 Information theory and Coding

M.M(50+100)

Objective : The objective of this course is to provide knowledge about the properties of codes and their fitness for a specific application that might be useful for the purpose of designing efficient and reliable data transmission methods.

Syllabus:

Introduction to information theory. Uncertainty, Information and Entropy, Information measures for continuous random variables, source coding theorem. Discrete Memory less channels, Mutual information, Conditional entropy.

Source coding schemes for data compaction: Prefix code, Huffman code, Shanon-Fane code & Hempel-Ziv coding channel capacity. Channel coding theorem. Shannon limit.

Linear Block Code: Introduction to error connecting codes, coding & decoding of linear block code, minimum distance consideration, conversion of non systematic form of matrices into systematic form.

Cyclic Code: Code Algebra, Basic properties of Galois fields (GF) polynomial operations over Galois fields, generating cyclic code by generating polynomial, parity check polynomial. Encoder & decoder for cyclic codes.

Convolutional Code: Convolutional encoders of different rates. Code Tree, Trllis and state diagram. Maximum likelihood decoding of convolutional code: The viterbi Algorithm fee distance of a convolutional code.

Scheme Code – 2015IT

5ITU06.1 Embedded System

M.M(50+100)

Embedded Computing Requirements: Characteristics and applications of embedded systems; Components of Embedded Systems; challenges in Embedded System Design and design process; Formalism for system design.

Embedded Processors: RISC vs. CISC architectures; ARM processor – processor architecture and memory organization, instruction set, data operations and flow control; SHARC processor – memory organization, data operations and flow control, parallelism within instructions; Input and output devices, supervisor mode, exception and traps; Memory system, pipelining and superscalar execution.

Embedded Computing Platform: CPU Bus – Bus protocols, DMA, system bus configurations, ARM bus; Timers and counters, A/D and D/A converters, Keyboards, LEDs, displays and touch screens; Design examples.

Embedded Software Analysis and Design: Software design pattern for Embedded Systems; Model programs – data flow graphs and control/data flow graphs; Assembly and linking; Compilation techniques; Analysis and optimization of execution time, energy, power and program size.

Embedded System Accelerators: Processor accelerators, accelerated system design

Recommended Book:

1. Computer as Components by Wayne Wolf published by Elsevier Inc

2. ARM System Developer's Guide by Andrew S. Loss published by Elsevier Inc

3. Embedded System Design by Steve Heath published by Elsevier Inc

4. Embedded System design: A unified hardware/software Introduction by Frank Vahid & Tony Givagi published by John Wiley & Sons Inc.

5ITU06.2 Human Computer Interface

M.M(50+100)

The Human: input-output channels, Human memory, thinking, emotions, individual differences, psychology and the design of interactive systems. The Computer: Text entry devices with focus on the design of key boards, positioning, pointing and drawing, display devices. The Interaction: Models of interaction, ergonomics, interaction styles, elements of WIMP interfaces, interactivity, experience, engagement and fun. Paradigms for Interaction.

Design Process: The process of design, user focus, scenarios, navigation design screen design and layout, iteration & prototyping. Usability Engineering Design rules: Principles to support usability, standards, guidelines, rules and heuristics, HCI patterns.

Evaluation Techniques: Definition and goals of evaluation, evaluation through expert analysis and user participation, choosing an evaluation method. User support, requirement, approaches, adaptive help systems, designing user support systems.

Cognitive methods: Goals and task hierarchies, linguistic models, challenges of display based systems, physical and device models, cognitive architectures.

Communications and collaborations models: Face to Face communication, conversations, Text based communication, group working. Task Analysis: Differences between task analysis and other techniques, task decomposition, knowledge based analysis, ER based analysis, sources of information and data collection, use of task analysis.

5ITU06.3 VLSI

M.M(50+100)

Methods of verification, validation, level of validation, principle of testing, static testing, structural testing, Regression Testing ,Integration Testing, Scenario testing, Defect bash. Internationalization testing, localization testing, ad-hoc testing-overview, buddy testing, pair testing, iterative testing agile and extreme testing, Usability and Accessibility Testing. Test Planning, Test Management, Test reporting, Test Project matrices

The management spectrum, 4Ps, W5HHprinciple, critical practices, Metrics in the process and project Domains, software measurements, metrics for software quality

Software project objective, Software scope, resources, software project estimation, Decomposition techniques, empirical estimation models, estimation for Agile development and web engineering projects, the make/buy decision. Project Scheduling, Relationship between people and effort, defining a task set and task network, scheduling, earned value analysis

Project Execution and Closure: The Review Process, Planning, Group Review Meeting, Rework and Follow-up, Guidelines for Reviews in Projects, Data Collection, Analysis and Control Guidelines, NAH Syndrome.

Project Monitoring and Control: Project Tracking, Activities Tracking, Defect Tracking, Issues Tracking, Status Reports, Milestone Analysis, Actual Versus Estimated Analysis of Effort and Schedule, Monitoring Quality, Risk-Related Monitoring.

Scheme Code – 2015IT

5ITU07 Database Management Lab

M.M(50+25)

Objectives: At the end of the semester, the students should have clearly understood and implemented the following:

1. Stating a database design & application problem.

2. Preparing ER diagram

3. Finding the data fields to be used in the database.

4. Selecting fields for keys.

5. Normalizing the database including analysis of functional dependencies.

6. Installing and configuring the database server and the front end tools.

7. Designing database and writing applications for manipulation of data for a standalone and shared data base including concepts like concurrency control, transaction roll back, logging, report generation etc.

8. Get acquainted with SQL. In order to achieve the above objectives, it is expected that each students will chose one problem. The implementation shall being with the statement of the objectives to be achieved, preparing ER diagram, designing of database, normalization and finally manipulation of the database including generation of reports, views etc. The problem may first be implemented for a standalone system to be used by a single user. All the above steps may then be followed for development of a database application to be used by multiple users in a client server environment with access control. The application shall NOT use web techniques. One exercise may be assigned on creation of table, manipulation of data and report generation using SQL.

Suggested Tool:

For standalone environment, Visual FoxPro or any similar database having both the database and manipulation language may be used. For multi-user application, MYSql is suggested. However, any other database may also be used.

For front end, VB.Net, Java, VB Script or any other convenient but currently used by industry may be chosen. Indicative List of exercise:

1. Student information system for your college.
2. Student grievance registration and redressal system.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

3. A video library management system for a shop.

4. Inventory management system for a hardware/ sanitary item shop.

5. Inventory management system for your college.

6. Guarantee management system for the equipments in your college.

Scheme Code – 2015IT

5ITU08 Java Programming Lab

M.M(50+25)

Objectives: At the end of the semester, the students should have clearly understood and implemented the following:

1. Develop an in depth understanding of programming in Java: data types, variables, operators, operator precedence, Decision and control statements, arrays, switch statement, Iteration Statements, Jump Statements, Using break, Using continue, return.

2. Write Object Oriented programs in Java: Objects, Classes constructors, returning and passing objects as parameter, Inheritance, Access Control, Using super, final with inheritance Overloading and overriding methods, Abstract classes, Extended classes.

3. Develop understanding to developing packages & Interfaces in Java: Package, concept of CLASSPATH, access modifiers, importing package, Defining and implementing interfaces.

4. Develop understanding to developing Strings and exception handling: String constructors, special string operations, character extraction, searching and comparing strings, string Buffer class. Exception handling fundamentals, Exception types, uncaught exceptions, try, catch and multiple catch statements. Usage of throw, throws and finally.

5. Develop applications involving file handling: I/O streams, File I/O.

6. Develop applications involving concurrency: Processes and Threads, Thread Objects, Defining and Starting a Thread, Pausing Execution with Sleep, Interrupts, Joins, and Synchronization.

7. Develop applications involving Applet: Applet Fundamentals, using paint method and drawing polygons.

It is expected that each laboratory assignments to given to the students with an aim to in order to achieve the above objectives

Indicative List of exercises:

1. Programs to demonstrate basic concepts e.g. operators, classes, constructors, control & iteration statements, recursion etc. such as complex arithmetic, matrix arithmetic, tower of Hanoi problem etc.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

2. Development of programs/projects to demonstrate concepts like inheritance, exception handling, packages, interfaces etc. such as application for electricity department, library management, ticket reservation system, payroll system etc.

3. Development of a project to demonstrate various file handling concepts.

4. Development of a project to demonstrate various applet concepts.

Scheme Code – 2015IT

5ITU09 WEB PROGRAMMING Lab

M.M(50+25)

OBJECTIVES:

- Be familiar with Web page design using HTML / DHTML and style sheet

- Be exposed to creation of user interfaces using Java frames and applets.

- Learn to create dynamic web pages using server side scripting.

- Learn to write PHP database functions.

LIST OF EXPERIMENTS:

1. Write a html program for Creation of web site with forms, frames, links, tables etc

2. Design a web site using HTML and DHTML. Use Basic text Formatting, Images,

3. Create a script that asks the user for a name, then greets the user with "Hello" and the user name on the page

4. Create a script that collects numbers from a page and then adds them up and prints them to a blank field on the page.

5. Create a script that prompts the user for a number and then counts from 1 to that number displaying only the odd numbers.

6. Create a script that will check the field in Assignment 1 for data and alert the user if it is blank. This script should run from a button.

7. Using CSS for creating web sites

8. Creating simple application to access data base using JDBC Formatting HTML with CSS.

9. Program for manipulating Databases and SQL.

10. Program using PHP database functions.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

5ITU10 CASE Lab

M.M(50+25)

Objectives: The students shall be able to use following modules of UML for system description, implementation and finally for product development

- Capture a business process model.

- The User Interaction or Use Case Model - describes the boundary and interaction between the system and users. Corresponds in some respects to a requirements model.

- The Interaction or Communication Model - describes how objects in the system will interact with each other to get work done.

- The State or Dynamic Model - State charts describe the states or conditions that classes assume over time. Activity graphs describe the workflows the system will implement.

- The Logical or Class Model - describes the classes and objects that will make up the system.

- The Physical Component Model - describes the software (and sometimes hardware components) that make up the system.

- The Physical Deployment Model - describes the physical architecture and the deployment of components on that hardware architecture.

The students are expected to use the UML models, prepare necessary documents using UML and implement a system. Some hardware products like digital clock, digital camera, washing machine controller, air conditioner controller, an elctronic fan regulator, an elementary mobile phone etc. may also be chosen.

The students shall be assigned one problem on software based systems and another involving software as well as hardware.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19

6ITU01 Computer Graphics

MAX_MARKS(50+100)

Objectives:

This course provides an introduction to the principles of computer graphics. In particular, the course will consider methods for modeling 3-dimensional objects and efficiently generating photorealistic renderings on color raster graphics devices. The emphasis of the course will be placed on understanding how the various elements that underlie computer graphics (algebra, geometry, algorithms and data structures, optics, and photometry) interact in the design of graphics software systems

Syllabus:

Introduction to Raster scan displays, Storage tube displays, refreshing, flicking, interlacing, color monitors, display processors, resolution, Introduction to Interactive. Computer Graphics: Picture analysis, Overview of programmer's model of interactive graphics, Fundamental problems in geometry. Scan Conversion: point, line, circle, ellipse polygon, Aliasing, and introduction to Anti Aliasing (No anti aliasing algorithm).

2D & 3D Co-ordinate system: Homogeneous Co-ordinates, Translation, Rotation, Scaling, Reflection, Inverse transformation, Composite transformation. Polygon Representation, Flood Filling, Boundary filling. Point Clipping, Cohen-Sutherland Line Clipping Algorithm, Polygon Clipping algorithms.

Hidden Lines & Surfaces: Image and Object space, Depth Buffer Methods, Hidden Facets removal, Scan line algorithm, Area based algorithms. Curves and Splines: Parametric and Non parametric Representations, Bezier curve, BSpline Curves.

Rendering: Basic illumination model, diffuse reflection, specular reflection, phong shading, Gourand shading, ray tracing, color models like RGB, YIQ, CMY, HSV

TEXT BOOKS:
1. J. Foley, A. Van Dam, S. Feiner, J. Hughes: Computer Graphics- Principles and Practice, Pearson
2. Hearn and Baker: Computer Graphics, PHI

Scheme Code – 2015IT

6ITU02 Information security system

MAX_MARKS(50+100)

Objectives:

1. To provide an understanding of principal concepts, major issues, technologies and basic approaches in information security.
2. Develop an understanding of information assurance as practiced in computer operating systems, distributed systems, networks and representative applications.
3. Gain familiarity with prevalent network and distributed system attacks, defenses against them and forensics to investigate the aftermath
4. Develop a basic understanding of cryptography, how it has evolved and some key encryption techniques used today.
5. Develop an understanding of security policies (such as authentication, integrity and confidentiality), as well as protocols to implement such policies in the form of message exchanges.

Syllabus:

Introduction to security attacks, services and mechanism, classical encryption techniques-substitution ciphers and transposition ciphers, cryptanalysis, stream and block ciphers. Modern Block Ciphers: Block ciphers principals, Shannon's theory of confusion and diffusion, fiestal structure, data encryption standard(DES), differential and linear cryptanalysis of DES, block cipher modes of operations, triple DES.

AES, RC6, random number generation. S-box theory: Boolean Function, S-box design criteria, Bent functions, Propagation and nonlinearity, construction of balanced functions, S-box design.

Public Key Cryptosystems: Principles of Public Key Cryptosystems, RSA Algorithm, security analysis of RSA, Exponentiation in Modular Arithmetic. Key Management in Public Key Cryptosystems: Distribution of Public Keys, Distribution of Secret keys using Public Key Cryptosystems. X.509 Discrete Logarithms, Diffie-Hellman Key Exchange.

Message Authentication and Hash Function: Authentication requirements, authentication functions, message authentication code, hash functions, birthday attacks, security of hash functions and MAC, MD5 message digest algorithm, Secure hash algorithm(SHA). Digital Signatures: Digital Signatures, authentication protocols, digital signature standards (DSS), proof of digital signature algorithm. Remote user Authentication using symmetric and Asymmetric Authentication

Pretty Good Privacy. IP Security: Overview, IP Security Architecture, Authentication Header, Encapsulation Security Payload in Transport and Tunnel mode with multiple security associations (Key Management not Included). Strong Password Protocols: Lamport's Hash, Encrypted Key Exchange.

Scheme Code – 2015IT

6ITU03 COMPILER CONSTRUCTION

MAX_MARKS(50+100)

Objectives:

The aim of this module is to show how to apply the theory of language translation introduced in the prerequisite courses to build compilers and interpreters. It covers the building of translators both from scratch and using compiler generators. In the process, the module also identifies and explores the main issues of the design of translators. The construction of a compiler/interpreter for a small language is a necessary component of this module, so students can obtain the necessary skills

Syllabus:

Compiler, Translator, Interpreter definition, Phase of compiler introduction to one pass & Multipass compilers, Bootstrapping, Review of Finite automata lexical analyzer, Input, buffering, Recognition of tokens, Idea about LEX: A lexical analyzer generator, Error handling.

Review of CFG Ambiguity of grammars, Introduction to parsing. Bottom up parsing Top down parsing techniques, Shift reduce parsing, Operator precedence parsing, Recursive descent parsing predictive parsers. LL grammars & passers error handling of LL parser. LR parsers, Construction of SLR, Conical LR & LALR parsing tables, parsing with ambiguous grammar. Introduction of automatic parser generator: YACC error handling in LR parsers.

Syntax directed definitions; Construction of syntax trees, L-attributed definitions, Top down translation. Specification of a type checker, Intermediate code forms using postfix notation and three address code, Representing TAC using triples and quadruples, Translation of assignment statement. Boolean e xpression and control structures.

Storage organization, Storage allocation, Strategies, Activation records, Accessing local and non local names in a block structured language, Parameters passing, Symbol table organization, Data structures used in symbol tables.

Definition of basic block control flow graphs, DAG representation of basic block, Advantages of DAG, Sources of optimization, Loop optimization, Idea about global data flow analysis, Loop invariant computation, Peephole optimization, Issues in design of code generator, A simple code generator, Code generation from DAG.

Scheme Code – 2015IT

6ITU04 INFORMATION STORAGE AND MANAGEMENT

MAX_MARKS(50+100)

Objectives:

After successful completion of the course, the students should be able to

1. Evaluate storage architectures, including storage subsystems, DAS, SAN, NAS, CAS
2. Define backup, recovery, disaster recovery, business continuity, and replication
3. Examine emerging technologies including IP-SAN
4. Understand logical and physical components of a storage infrastructure
5. Identify components of managing and monitoring the data center
6. Define information security and identify different storage virtualization technologies

Syllabus:

Introduction to Storage Technology: Data creation and The value of data to a business, InformationLifecycle, Challenges in data storage and data management, Solutions available for data storage, Core elements of a Data Center infrastructure, role of each element in supporting business activities.

Storage Systems Architecture: Hardware and software components of the host environment, Key protocols and concepts used by each component ,Physical and logical components of a connectivity environment ,Major physical components of a disk drive and their function, logical constructs of a physical disk, access characteristics, and performance Implications, Concept of RAID and its components, Different RAID levels and their suitability for different application environments: RAID 0, RAID 1, RAID 3, RAID 4, RAID 5, RAID 0+1, RAID 1+0, RAID 6, Integrated and Modular storage systems ,high-level architecture and working of an intelligent storage system

Introduction to Networked Storage: Evolution of networked storage, Architecture, components, andtopologies of FC-SAN, NAS, and IP-SAN, Benefits of the different networked storage options, Understand the need for long-term archiving solutions and describe how CAS fulfil the need, Understand the appropriateness of the different networked storage options for different application environments.

Information Availability, Monitoring & Managing Data Center: Reasons for planned/unplanned outagesand the impact of downtime, Impact of downtime. Differentiate between business continuity (BC) and disaster recovery (DR), RTO and RPO, Identification of single points of failure in a storage infrastructure and solutions to mitigate these failures, Architecture of backup/recovery and the different backup/ recovery topologies, replication technologies and their role in ensuring information availability and business continuity, Remote replication technologies and their role in providing disaster recovery and business continuity capabilities. Key areas to monitor in a data center, Industry standards for data center monitoring and management, Key metrics to monitor storage infrastructure.

Securing Storage and Storage Virtualization: Information Security, Critical security attributes forinformation systems, Storage security domains, Analyze the common threats in each domain.

6ITU05 MOBILE COMPUTING

MAX_MARKS(50+100)

Objective : This course will give you an understanding of mobile computer systems particularly in the context of wireless network systems such as 2G/3G/4G mobile telephony, data networks, and other wireless networks and infrastructure. The course emphasises how to interface hardware to mobile computing devices, and programming those devices..

Syllabus:

Mobile computing: Definitions, adaptability issues (transparency, Environmental Constraints, application aware adaptation), mechanisms for adaptation and incorporating adaptations. Mobility management: mobility management, location management principle and techniques, PCS location management Scheme.

Data dissemination and management: challenges, Data dissemination, bandwidth allocation for publishing, broadcast disk scheduling, mobile cache maintenance schemes, Mobile Web Caching. Introduction to mobile middleware.

Middleware for application development: adaptation, Mobile agents. Service Discovery Middleware: Service Discovery & standardization Methods (universally Unique Identifiers, Textual Description & using interfaces), unicast Discovery, Multicast Discovery & advertisement, service catalogs, Garbage Collection, Eventing.

Mobile IP, Mobile TCP, Database systems in mobile environments, World Wide Web and mobility

Ad Hoc networks, localization, MAC issues, Routing protocols, global state routing (GSR), Destination sequenced distance vector routing (DSDV), Dynamic source routing (DSR), Ad Hoc on demand distance vector routing (AODV), Temporary ordered routing algorithm (TORA), QoS in Ad Hoc Networks, applications.

TEXT BOOKS:

6ITU06.1 ARTIFICIAL INTELLIGENCE

MAX_MARKS(50+100)

Objective: The objective of the course is to present an overview of artificial intelligence (AI) principles and approaches. Develop a basic understanding of the building blocks of AI as presented in terms of intelligent agents: Search, Knowledge representation, inference, logic, and learning.

Syllabus:

Meaning and definition of artificial intelligence, Various types of production systems, Characteristics of production systems, Study and comparison of breadth first search and depth first search. Techniques, other Search Techniques like hill Climbing, Best first Search. A* algorithm, AO* algorithms etc, and various types of control strategies.

Knowledge Representation, Problems in representing knowledge, knowledge representation using propositional and predicate logic, comparison of propositional and predicate logic, Resolution, refutation, deduction, theorem proving, inferencing, monotonic and nonmonotonic reasoning.

Probabilistic reasoning, Baye's theorem, semantic networks scripts schemas, frames, conceptual dependency and fuzzy logic, forward and backward reasoning.

Game playing techniques like minimax procedure, alpha-beta cut-offs etc, planning, Study of the block world problem in robotics, Introduction to understanding and natural languages processing.

Introduction to learning, Various techniques used in learning, introduction to neural networks, applications of neural networks, common sense, reasoning, some example of expert systems.

TEXT BOOKS:

1. Artificial Intelligence: Elaine Rich, Kevin Knight, Mc-Graw Hill.

2. Introduction to AI & Expert System: Dan W. Patterson, PHI.

3. Artificial Intelligence by Luger (Pearson Education)

4. Russel & Norvig, Artificial Intelligence: A Modern Approach, Prentice-Hall

Scheme Code – 2015IT

6ITU06.2 DATA MINING AND WAREHOUSE

MAX_MARKS(50+100)

Objectives:

1. To introduce the basic concepts of Data Warehouse and Data Mining techniques.
2. Examine the types of the data to be mined and apply preprocessing methods on raw data.

3. Discover interesting patterns, analyze supervised and unsupervised models and estimate the accuracy of the algorithms.

Syllabus:

Overview, Motivation(for Data Mining),Data Mining-Definition & Functionalities, Data Processing, Form of Data Preprocessing, Data Cleaning: Missing Values, Noisy Data, (Binning, Clustering, Regression, Computer and Human inspection), Inconsistent Data, Data Integration and Transformation. Data Reduction:-Data Cube Aggregation, Dimensionality reduction, Data Compression, Numerosity Reduction, Clustering, Discretization and Concept hierarchy generation.

Concept Description: Definition, Data Generalization, Analytical Characterization, Analysis of attribute relevance, Mining Class comparisons, Statistical measures in large Databases. Measuring Central Tendency, Measuring Dispersion of Data, Graph Displays of Basic Statistical class Description, Mining Association Rules in Large Databases, Association rule mining, mining Single-Dimensional Boolean Association rules from Transactional Databases– Apriori Algorithm, Mining Multilevel Association rules from Transaction Databases and Mining Multi-Dimensional Association rules from Relational Databases.

What is Classification & Prediction, Issues regarding Classification and prediction, Decision tree, Bayesian Classification, Classification by Back propagation, Multilayer feed-forward Neural Network, Back propagation Algorithm, Classification methods K-nearest neighbour classifiers, Genetic Algorithm. Cluster Analysis: Data types in cluster analysis, Categories of clustering methods, Partitioning methods. Hierarchical Clustering- CURE and Chameleon. Density Based Methods-DBSCAN, OPTICS. Grid Based Methods- STING, CLIQUE. Model Based Method –Statistical Approach, Neural Network approach, Outlier Analysis.

Data Warehousing: Overview, Definition, Delivery Process, Difference between Database System and Data Warehouse, Multi Dimensional Data Model, Data Cubes, Stars, Snow Flakes, Fact Constellations, Concept hierarchy, Process Architecture, 3 Tier Architecture, Data Mining.

Aggregation, Historical information, Query Facility, OLAP function and Tools. OLAP Servers, ROLAP, MOLAP, HOLAP, Data Mining interface, Security, Backup and Recovery, Tuning Data Warehouse, Testing Data Warehouse.

Scheme Code – 2015IT

6ITU06.3 FUZZY LOGIC AND APPLICATIONS

MAX_MARKS(50+100)

Objectives:

The objective of this course is to teach the students the need of fuzzy sets, arithmetic operations on fuzzy sets, fuzzy relations, possibility theory, fuzzy logic, and its applications

Pre-requisites: Basic knowledge of algebra and analysis at the level of undergraduate studies

Syllabus:

Classical sets vs Fuzzy Sets , Need for fuzzy sets , Definition and Mathematical representations , Level Sets , Fuzzy functions , Zadeh's Extension Principle

Operations on [0,1] – Fuzzy negation, triangular norms, t-conorms, fuzzy implications, Aggregation Operations, Fuzzy Functional Equations

Fuzzy Binary and n-ary relations – composition of fuzzy relations – Fuzzy Equivalence Relations – Fuzzy Compatibility Relations – Fuzzy Relational Equations

Fuzzy Measures – Evidence Theory – Necessity and Belief Measures – Probability Measures vs Possibility Measures

Fuzzy Decision Making - Fuzzy Relational Inference – Compositional Rule of Inference - Efficiency of Inference - Hierarchical

Fuzzy If-Then Rule Base – Inference Engine – Takagi-Sugeno Fuzzy Systems - Function Approximation

Scheme Code – 2015IT

6ITU07 Computer graphics & multimedia lab

MAX_MARKS(50+25)

List of Experiment

1 Implementation of Line, Circle and ellipse attributes.

2 Two Dimensional transformations - Translation, Rotation, Scaling, Reflection, Shear.

3 Composite 2D Transformations.

4 Cohen Sutherland 2D line clipping and Windowing.

5 Sutherland – Hodgeman Polygon clipping Algorithm.

6 Three dimensional transformations - Translation, Rotation, Scaling.

7 Composite 3D transformations.

8 Drawing three dimensional objects and Scenes.

9 Generating Fractal images.

10 To plot a point (pixel) on the screen.

11 To draw a straight line using DDA Algorithm.

12 Implementation of mid-point circle generating Algorithm.

13 Implementation of ellipse generating Algorithm.

14 To translate an object with translation parameters in X and Y directions.

15 To scale an object with scaling factors along X and Y directions.

16 To rotate an object with a certain angle about origin.

17 Perform the rotation of an object with certain angle about an arbitrary point.

Scheme Code – 2015IT

6ITU08 Advance Communication Lab

MAX_MARKS(50+25)

List of Experiments:

1. TDM of two band limited signals.

2. ASK and FSK generation and detection

3. PSK generation and detection

4. DPSK generation and detection

5. QPSK generation and detection

6. PCM generation and detection using a CODEC Chip

7. Measurement of losses in a given optical fiber (propagation loss, bending loss) and numerical aperture

8. Analog and Digital (with TDM) communication link using optical fiber.

9. Measurement of frequency, guide wavelength, power, VSWR and attenuation in a microwave test bench

10. Measurement of directivity and gain of antennas: Standard dipole (or printed dipole), microstrip patch antenna and Yagi antenna (printed).

11. Determination of coupling and isolation characteristics of a stripline (or microstrip) directional coupler

12. (a) Measurement of resonance characteristics of a microstrip ring resonator and determination of dielectric constant of the substrate.

(b) Measurement of power division and isolation characteristics of a microstrip 3 dB power divide

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

6ITU09 Compiler Construction lab

MAX_MARKS(50+25)

Objectives:

At the end of the semester, the students should have clearly understood and implemented the following:

1. Develop an in depth understanding of system programming concept. Lexical analysis, syntax analysis, semantics analysis, code optimization, code generation. Language specification and processing.

2. Develop an Understanding of Scanning by using concept of Finite state automaton. Parse tree and syntax tree, Top down parsing (recursive decent parsing, LL (1) parser) Bottom up parsing (operator precedence parsing) .Managing symbol table, opcode table, literal table, pool table.

3. Develop an Understanding of Intermediate code form: Three address code, Polish notation (Postfix strings)

4. Develop an Understanding of Allocation data structure. Heaps.

5. Develop an Understanding about Language processor development tools: LEX, YACC. Language processing activities (Program generation and execution)

It is expected that each laboratory assignments to given to the students with an aim to In order to achieve the above objectives

Indicative List of exercises:

1. Write grammar for a fictitious language and create a lexical analyzer for the same.

2. Develop a lexical analyzer to recognize a few patterns in PASCAL and C (ex: identifiers, constants, comments, operators etc.)

3. Write a program to parse using Brute force technique of Top down parsing

4. Develop on LL (1) parser (Construct parse table also).

5. Develop an operator precedence parser (Construct parse table also)

6. Develop a recursive descent parser

7. Write a program for generating for various intermediate code forms
   i) Three address code ii) Polish notation

8. Write a program to simulate Heap storage allocation strategy

9. Generate Lexical analyzer using LEX

10. Generate YACC specification for a few syntactic categories

11. Given any intermediate code form implement code optimization techniques

Scheme Code – 2015IT

6ITU10 Advance Java lab

MAX_MARKS(50+25)

List of Experiment

1. Use Eclipse or Netbean platform and acquaint with the various menus. Create a test project, and a test class and run it. See how you can use auto suggestions, auto fill. Try code formatter and code refactoring like renaming variables, methods and classes. Try debug step by step with a small program of about 10 to 15 lines which contains at least one if else condition and a for loop.
2. Write a Java program that works as a simple calculator. Use a grid layout to arrange buttons for the digits and for the +, -,*, % operations. Add a text field to display the result. Handle any possible exceptions like divided by zero.
3. Develop an applet that displays a simple message.
4. Develop an applet that receives an integer in one text field, and computes its factorial Value and returns it in another text field, when the button named "Compute" is clicked.
5. Write a program that creates a user interface to perform integer divisions. The user enters two numbers in the textfields, Num1 and Num2. The division of Num1 and Num2 is displayed in the Result field when the Divide button is clicked. If Num1 or Num2 were not an integer, the program would throw a NumberFormatException. If Num2 were Zero, the program would throw an ArithmeticException. Display the exception in a message dialog box.
6. Write a Java program that implements a multi-thread application that has three threads. First thread generates random integer every 1 second and if the value is even, second thread computes the square of the number and prints. If the value is odd, the third thread will print the value of cube of the number.
7. Write a Java program that connects to a database using JDBC and does add, delete, modify and retrieve operations.
8. Write a Java program that simulates a traffic light. The program lets the user select one of three lights: red, yellow, or green with radio buttons. On selecting a button, an 63-69 6 appropriate message with "Stop" or "Ready" or "Go" should appear above the buttons in selected color. Initially there is no message shown.
9. Write a java program to create an abstract class named Shape that contains two integers and an empty method named printArea(). Provide three classes named Rectangle, Triangle and Circle such that each one of the classes extends the class Shape. Each one of the classes contains only the method printArea() that prints the area of the given shape.
10. Suppose that a table named Table.txt is stored in a text file. The first line in the file is the header, and the remaining lines correspond to rows in the table. The elements are separated by commas. Write a java program to display the table using Labels in Grid Layout.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

11. Write a Java program that handles all mouse events and shows the event name at the center of the window when a mouse event is fired (Use Adapter classes).
12. Write a Java program that loads names and phone numbers from a text file where the data is organized as one line per record and each field in a record are separated by a tab (\t). It takes a name or phone number as input and prints the corresponding other value from the hash table (hint: use hash tables).
13. Implement the above program with database instead of a text file.
14. Write a Java program that takes tab separated data (one record per line) from a text file and inserts them into a database.
15. Write a Java program that prints the meta-data of a given table

7ITU01 CLOUD COMPUTING

MAX_MARKS(50+100)

Objectives:
The student will learn about the cloud environment, building software systems and components that scale to millions of users in modern internet, cloud concepts capabilities across the various cloud service models including Iaas,Paas,Saas, and developing cloud based software applications on top of cloud platforms.

Syllabus:
Introduction Cloud Computing: Nutshell of cloud computing, Enabling Technology, Historical development, Vision, feature Characteristics and components of Cloud Computing. Challenges, Risks and Approaches of Migration into Cloud. Ethical Issue in Cloud Computing, Evaluating the Cloud's Business Impact and economics, Future of the cloud. Networking Support for Cloud Computing. Ubiquitous Cloud and the Internet of Things

Cloud Computing Architecture: Cloud Reference Model, Layer and Types of Clouds, Services models, Data center Design and interconnection Network, Architectural design of Compute and Storage Clouds. Cloud Programming and Software: Fractures of cloud programming, Parallel and distributed programming paradigms-MapReduce, Hadoop , High level Language for Cloud. Programming of Google App engine.

Virtualization Technology: Definition, Understanding and Benefits of Virtualization. Implementation Level of Virtualization, Virtualization Structure/Tools and Mechanisms , Hypervisor VMware, KVM, Xen. Virtualization: of CPU, Memory, I/O Devices, Virtual Cluster and Resources Management, Virtualization of Server , Desktop, Network, and Virtualization of data-center.

Securing the Cloud : Cloud Information security fundamentals, Cloud security services, Design principles, Policy Implementation, Cloud Computing Security Challenges, Cloud Computing Security Architecture . Legal issues in cloud Computing. Data Security in Cloud: Business Continuity and Disaster Recovery , Risk Mitigation , Understanding and Identification of Threats in Cloud, SLA-Service Level Agreements, Trust Management.

Cloud Platforms in Industry: Amazon web services , Google AppEngine, Microsoft Azure Design, Aneka: Cloud Application Platform -Integration of Private and Public Clouds Cloud applications: Protein structure prediction, Data Analysis, Satellite Image Processing, CRM and ERP ,Social networking . Cloud Application- Scientific Application, Business Application. Advance Topic in Cloud Computing: Federated Cloud/InterCloud, Third Party Cloud Services

TEXT BOOKS:
1. " Distributed and Cloud Computing " By Kai Hawang , Geofrey C.Fox, Jack J. Dongarra Pub: Elservier

Scheme Code – 2015IT

7ITU02 REAL TIME SYSTEM

MAX_MARKS(50+100)

Objectives:
To introduce students to the fundamental problems, concepts, and approaches in the design and analysis of real-time systems. To study issues related to the design and analysis of systems with real-time constraints.

Syllabus:
Introduction: Definition, Typical Real Time Applications, concept of tasks, types of tasks and real time systems, block diagram of RTS, and tasks parameters -Release Times, execution time, period, Deadlines, and Timing Constraints etc. RTS requirements.

Reference Models for Real Time Systems: processors and Resources, Temporal Parameters of Real-Time Workload, Periodic and Aperiodic Task Model, Precedence Constrains and Data Dependency, Other Types of Dependencies, Functional Parameters, Resource Parameters. Real Time Scheduling: classification of Real Time Scheduling, scheduling criteria, performance metrics, schedulability analysis, Introduction to Clock Driven scheduling, Weighted Round Robin Approach and Priority Driven Approach. Dynamic Versus Static systems, Offline Versus Online Scheduling.

Periodic tasks scheduling: Clock Driven Scheduling – definition, notations and assumption, scheduler concepts, general scheduling structure, cyclic executives. Priority Driven Scheduling; notations and assumption, fixed priority verses dynamic priority, fixed priority scheduling algorithms (RM and DM) and their schedulability analysis, concept of schedulability tests – Inexact and exact schedulability tests for RM and DM, Optimality of the RM and DM algorithms, practical factors.

Aperiodic task scheduling; assumption and approaches, server based and non-server based fixed priority scheduling algorithms – polling server, deferrable server , simple sporadic server, priority exchange, extended priority exchange, slack stealing. Introduction to scheduling of flexible computations –flexible applications, imprecise computation model and firm deadline model.

Resources Access Control: Assumptions on Resources and their usage, Effect of Resource Contention and Resource Access Control (RAC), Non-preemptive Critical Sections, priority inversion problem, need of new resource synchronization primitives/protocols for RTS, Basic Priority-Inheritance and Priority-Ceiling Protocols, Stack Based Priority-Ceiling Protocol, Use of Priority- Ceiling Protocol in Dynamic Priority Systems, Preemption Ceiling Protocol, Access Control in MultipleUnit Resources, Controlling Concurrent Accesses to Data Objects

TEXT BOOKS

Scheme Code – 2015IT

7ITU03 SOFTWARE TESTING AND PROJECT MANAGEMENT
MAX_MARKS(50+100)

Objectives:
1. To study fundamental concepts in software testing, including software testing objectives, process, criteria, strategies, and methods.
2. To learn how to planning a test project, design test cases and data, conduct testing operations, manage software problems and defects, generate a testing report.
3. Understand the fundamental principles of Software Project*v* management & will also have a good knowledge of responsibilities of project manager and how to handle these.

Syllabus:
Introduction of software testing, verification, methods of verification, validation, level of validation, principle of testing, context of texting in producing software, white box testing ,black box testing, Integration Testing, Regression Testing techniques, Testing of object oriented system .

Test planning, Test management, Test process and reporting,Software test automation, design and architecture of automation, process model for automation, test matrices and measurement-type of metrics, project metrics, productivity metrics, progress metrics, release metrics.

Project Management: The management spectrum, the people, the product, the process, the project, the W5HH principle, critical practices

Project estimation, Project Scheduling, Risk Management, Quality Planning, Quality Management, Project Execution And Closure: The Review Process, Project Monitoring and Control, Project Closure

REFRENCES:
1. R. S. Pressman, Software Engineering
2. Pankaj Jalote, Software project management in practice, Addison-Wesley
3. B. Hughest & M. Cotterell, Software Project Management.

7ITU04 DIGITAL IMAGE PROCESSING

MAX_MARKS(50+100)

Objectives:
To learn and understand the fundamentals of digital image processing, and various image Transforms, Image Enhancement Techniques, Image restoration Techniques and methods, image compression and Segmentation used in digital image processing.

Syllabus:
Introduction to Image Processing: Digital Image representation, Sampling & Quantization, Steps in image Processing, Image acquisition, color image representation

Image Transformation & Filtering: Intensity transform functions, histogram processing, Spatial filtering, Fourier transforms and its properties, frequency domain filters, colour models, Pseudo colouring, colour transforms, Basics of Wavelet Transforms

Image Restoration: Image degradation and restoration process, Noise Models, Noise Filters, degradation function, Inverse Filtering, Homomorphism Filtering

Image Compression: Coding redundancy, Interpixel redundancy, Psychovisual redundancy, Huffman Coding, Arithmetic coding, Lossy compression techniques, JPEG Compression
.
Image Segmentation & Representation: Point, Line and Edge Detection, Thresholding, Edge and Boundary linking, Hough transforms, Region Based Segmentation, Boundary representation, Boundary Descriptors, Regional

TEXT BOOKS:
 Pakhera Malay K: Digital Image Processing and Pattern Recogination, PHI.

REFRENCES:
1. Gonzalez and Woods: Digital Image Processing ISDN 0-201-600- 781, Addison Wesley 1992. Boyle and Thomas: Computer Vision - A First Gurse 2nd Edition, ISBN 0-632-028-67X, Blackwell Science 1995.
2. Gonzalez and Woods: Digital Image Processing ISDN 0-201-600- 781, Addison Wesley 1992

7ITU05 DISTRIBUTED SYSTEMS

MAX_MARKS(50+100)

Objective : The course aims to provide an understanding of the principles on which the Internet and other distributed systems are based; their architecture, algorithms and how they meet the demands of contemporary distributed applications.

Syllabus:

Distributed Systems: Features of distributed systems, nodes of a distributed system, Distributed computation paradigms, Model of distributed systems, Types of Operating systems: Centralized Operating System, Network Operating Systems, Distributed Operating Systems and Cooperative Autonomous Systems, design issues in distributed operating systems. Systems Concepts and Architectures: Goals, Transparency, Services, Architecture Models, Distributed Computing Environment (DCE). Theoretical issues in distributed systems: Notions of time and state, states and events in a distributed system, time, clocks and event precedence, recording the state of distributed systems.

Concurrent Processes and Programming: Processes and Threads, Graph Models for Process Representation, Client/Server Model, Time Services, Language Mechanisms for Synchronization, Object Model Resource Servers, Characteristics of Concurrent Programming Languages (Language not included).[1] Inter-process Communication and Coordination: Message Passing, Request/Reply and Transaction Communication, Name and Directory services, RPC and RMI case studies.

Distributed Process Scheduling: A System Performance Model, Static Process Scheduling with Communication, Dynamic Load Sharing and Balancing, Distributed Process Implementation.[1] Distributed File Systems: Transparencies and Characteristics of DFS, DFS Design and implementation, Transaction Service and Concurrency Control, Data and File Replication.[1,2] Case studies: Sun network file systems, General Parallel file System and Window's file systems. Andrew and Coda File Systems [2,3]

Distributed Shared Memory: Non-Uniform Memory Access Architectures, Memory Consistency Models, Multiprocessor Cache Systems, Distributed Shared Memory, Implementation of DSM systems.[1] Models of Distributed Computation: Preliminaries, Causality, Distributed Snapshots, Modeling a Distributed Computation, Failures in a Distributed System, Distributed Mutual Exclusion, Election, Distributed Deadlock handling, Distributed termination detection.

Distributed Agreement: Concept of Faults, failure and recovery, Byzantine Faults, Adversaries, Byzantine Agreement, Impossibility of Consensus and Randomized Distributed Agreement.[1] Replicated Data Management: concepts and issues, Database Techniques, Atomic Multicast, and Update Propagation.[1] CORBA case study: Introduction, Architecture, CORBA RMI, CORBA Services.

TEXT BOOKS:

1. Distributed operating systems and algorithm analysis by Randy Chow and T. Johnson, Pearson
2. Operating Systems A concept based approach by DM Dhamdhere, TMH
3. Distributed Systems- concepts and Design, Coulouris G., Dollimore J, and Kindberg T., Pearson

Scheme Code – 2015IT

7ITU06.1 ROBOTICS

MAX_MARKS(50+100)

Objective:
At the end of this course the student should be able to understand
1. The basics of robot
2. End effectors and robot controls
3. Robot Transformations and Sensors
4. Robot cell design and applications
5. Micro/Nano robotic systems

Syllabus:

INTRODUCTION: Robot anatomy-Definition, law of robotics, History and Terminology of Robotics-Accuracy and repeatability of Robotics-Simple problems Specifications of Robot-Speed of Robot-Robot joints and links-Robot classifications-Architecture of robotic systems-Robot Drive systems Hydraulic, Pneumatic and Electric system.

END EFFECTORS AND ROBOT CONTROLS : Mechanical grippers-Slider crank mechanism, Screw type, Rotary actuators, cam type-Magnetic grippers-Vacuum grippers-Air operated grippers-Gripper force analysis-Gripper design-Simple problems-Robot controls-Point to point control, Continuous path control, Intelligent robot-Control system for robot joint-Control actions-Feedback devices-Encoder, Resolver, LVDT-Motion Interpolations-Adaptive control.

ROBOT TRANSFORMATIONS AND SENSORS: Robot kinematics-Types- 2D, 3D Transformation-Scaling, Rotation, Translation- Homogeneous coordinates, multiple transformation-Simple problems. Sensors in robot – Touch sensors-Tactile sensor – Proximity and range sensors – Robotic vision sensor-Force sensor-Light sensors, Pressure sensors.

ROBOT CELL DESIGN AND APPLICATIONS : Robot work cell design and control-Sequence control, Operator interface, Safety monitoring devices in Robot-Mobile robot working principle, actuation using MATLAB, NXT Software Introductions-Robot applications Material handling, Machine loading and unloading, assembly, Inspection, Welding, Spray painting and undersea robot.

MICRO/NANO ROBOTICS SYSTEM : Micro/Nanorobotics system overview-Scaling effect-Top down and bottom up approach- Actuators of Micro/Nano robotics system-Nanorobot communication techniques-Fabrication of micro/nano grippers-Wall climbing micro robot working principles-Biomimetic robot-Swarm robot-Nanorobot in targeted drug delivery system.

7ITU06.2 CYBER SECURITY

MAX_MARKS(50+100)

Objectives:

The objective of this course is to gain a fundamental knowledge of what Cyber Security is and how it applies to your daily work. Gain a fundamental understanding of what an attack is, and how to identify and prevent them from occurring.

Syllabus:

Systems Vulnerability Scanning :Overview of vulnerability scanning, Open Port / Service Identification, Banner / Version Check, Traffic Probe, Vulnerability Probe, Vulnerability Examples, OpenVAS, Metasploit. Networks Vulnerability Scanning - Netcat, Socat, understanding Port and Services tools - Datapipe, Fpipe, WinRelay, Network Reconnaissance – Nmap, THC-Amap and System tools. Network Sniffers and Injection tools – Tcpdump and Windump, Wireshark, Ettercap, Hping Kismet

Network Defense tools: Firewalls and Packet Filters: Firewall Basics, Packet Filter Vs Firewall, How a Firewall Protects a Network, Packet Characteristic to Filter, Stateless Vs Stateful Firewalls, Network Address Translation (NAT) and Port Forwarding, the basic of Virtual Private Networks, Linux Firewall, Windows Firewall, Snort: Introduction Detection System

Web Application Tools: Scanning for web vulnerabilities tools: Nikto, W3af, HTTP utilities - Curl, OpenSSL and Stunnel, Application Inspection tools – Zed Attack Proxy, Sqlmap. DVWA, Webgoat, Password Cracking and Brute-Force Tools – John the Ripper, L0htcrack, Pwdump, HTC-Hydra

Introduction to Cyber Crime and law: Cyber Crimes, Types of Cybercrime, Hacking, Attack vectors, Cyberspace and Criminal Behavior, Clarification of Terms, Traditional Problems Associated with Computer Crime, Introduction to Incident Response, Digital Forensics, Computer Language, Network Language, Realms of the Cyber world, A Brief History of the Internet, Recognizing and Defining Computer Crime, Contemporary Crimes, Computers as Targets, Contaminants and Destruction of Data, Indian IT ACT 2000.

Introduction to Cyber Crime Investigation: Firewalls and Packet Filters, password Cracking, Keyloggers and Spyware, Virus and Warms, Trojan and backdoors, Steganography, DOS and DDOS attack, SQL injection, Buffer Overflow, Attack on wireless Networks

7ITU06.3 INTERNET OF THINGS

MAX_MARKS(50+100)

Objectives:

The objective of the course is to:

1 . Vision and Introduction to IoT .

2 . Understand IoT Market perspective.

3 . Data and Knowledge Management and use of Devices in IoT T echnology .

4 . Understand State of the Art – IoT Architecture.

5 . Real World IoT Design Constraints, Industrial Automation and Commercial Building Automation in IoT

Syllabus:

M2M to IoT-The Vision-Introduction, From M2M to IoT , M2M towards IoT -the global context, A use case example, Differing Characteristics.

M2M to IoT – A Market Perspective– Introduction, Some Definitions, M2M V alue Chains, IoT V alue Chains, An emerging industrial structure for IoT , The international driven global value chain and global information monopolies.

M2M toIoT –An Architectural Overview– Building an architecture, Main design principles and needed capabilities, An IoT architecture outline, standards considerations.

M2M and IoT T echnology Fundamentals- Devices and gateways, Local and wide area networking, Data management, Business processes in IoT , Everything as a Service(XaaS), M2M and IoT Analytics, Knowledge Management

IoT Architecture-State of the Art – Introduction, State of the art,

Architecture Reference Model- Introduction, Reference Model and architecture, IoT reference Model

7ITU07 DIP LAB

Maximum Marks (50+25)

LIST OF LAB EXPERIMENTS:

1. Color image segmentation algorithm development
2. Wavelet/vector quantization compression
3. Deformable templates applied to skin tumor border finding
4. Helicopter image enhancement
5. High-speed film image enhancement
6. Computer vision for skin tumor image evaluation
7. New Border Images

Scheme Code – 2015IT

7ITU08   ANDROID LAB

Maximum Marks (50+25)

LIST OF LAB EXPERIMENTS:

1. Develop an application that uses GUI components, Font and Colors.

2. Develop an application that uses Layout Managers and event listeners.

3. Develop a native calculator application.

4. Write an application that draws basic graphical primitives on the screen.

5. Develop an application that makes use of database.

6. Develop an application that makes use of RSS Feed.

7. Implement an application that implements Multi threading.

8. Develop a native application that uses GPS location information.

9. Implement an application that writes data to the SD card.

10. Implement an application that creates an alert upon receiving a message.

11. Write a mobile application that creates alarm clock.

8ITU01 PATTERN RECOGNITION

MAX_MARKS(50+100)

Objective: After taking this course students will be able to design and implement supervised and unsupervised pattern classifiers. They will be able to apply feature extraction techniques on data sets from different domains. The course will provide a basis to apply the learnt algorithms on practical problems such as document recognition.

Syllabus:

Pattern Classifier: Overview of Pattern recognition; Discriminant functions; Supervised learning; Parametric estimation; Maximum Likelihood Estimation; Bayesian parameter Estimation; Problems with Bayes approach; Pattern classification by distance functions; Minimum distance pattern classifier.

Clustering: Basics of Clustering; Clustering vs. Classification; Supervised vs. unsupervised; similarity / dissimilarity measures; clustering criteria; Different distance functions and similarity measures; Minimum within cluster distance criterion; K-means algorithm; Hierarchical clustering, K Mediods, DBSCAN.

Feature Extraction and Structural Pattern Recognition: Principle component analysis, Independent component analysis, Linear discriminant analysis, Feature selection through functional approximation.

Hidden Markov Models and Support Vector Machine: State Machines; Hidden Markov Models: Training, Classification; Support Vector Machine; Feature Selection.
Recent Advances: Structural Pattern Recognition; Fuzzy Pattern Classifiers; Pattern Classification using Genetic Algorithms.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

8ITU02 BIG DATA USING HADOOP

MAX_MARKS(50+100)

Objectives: The objective of this course is tooptimize business decisions and create competitive advantage with Big Data analytics, introduce Java concepts required for developing map reduce programs, derive business benefit from unstructured data, impart the architectural concepts of Hadoop and introducing map reduce paradigm and to introduce programming tools PIG & HIVE in Hadoop echo system.

Syllabus:

Introduction to Big Data: Big data features and challenges, Problems with Traditional Large-Scale System , Sources of Big Data, 3 V's of Big Data, Types of Data.

Working with Big Data: Google File System.Hadoop Distributed File System (HDFS) - Building blocks of Hadoop (Namenode. Data node.Secondary Namenode.Job Tracker. Task Tracker), Introducing and Configuring Hadoop cluster (Local. Pseudo-distributed mode, Fully Distributed mode). Configuring XML files.

Writing MapReduce Programs: A Weather Dataset. Understanding Hadoop API for MapReduce Framework (Old and New). Basic programs of HadoopMapReduce: Driver code. Mapper code, Reducer code. Record Reader, Combiner. Partitioner.

Hadoop I/O: The Writable Interface. Writable Comparable and comparators. Writable Classes: Writable wrappers for Java primitives. Text.Bytes Writable.Null Writable, Object Writable and Generic Writable.Writable collections.Implementing a Custom Writable: Implementing a Raw Comparator for speed, Custom comparators.

Pig: Hadoop Programming Made Easier Admiring the Pig Architecture, Going with the Pig Latin Application Flow. Working through the ABCs of Pig Latin.Evaluating Local and Distributed Modes of Running Pig Scripts, Checking out the Pig Script Interfaces, Scripting with Pig Latin.

Applying Structure to Hadoop Data with Hive: Saying Hello to Hive, Seeing How the Hive is Put Together, Getting Started with Apache Hive.Examining the Hive Clients.Working with Hive Data Types.Creating and Managing Databases and Tables, Seeing How the Hive Data Manipulation Language Works, Querying and Analyzing Data.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19

Scheme Code – 2015IT

8ITU03.1 COMPUTER VISION

MAX_MARKS(50+100)

Objective: This course offers an introduction to computer vision concepts, including: image formation, edge detection, segmentation, perceptual grouping and object/activity recognition. Students will be able toapply the knowledge earned to develop real time projects related to the field.

Syllabus:

Digital Image Formation and low-level processing: Overview and State-of-the-art, Fundamentals of Image Formation, Transformation: Orthogonal, Euclidean, Affine, Projective, etc; Fourier Transform, Convolution and Filtering, Image Enhancement, Restoration, Histogram Processing.

Depth estimation and Multi-camera views: Perspective, Binocular Stereopsis: Camera and Epipolar Geometry; Homography, Rectification, DLT, RANSAC, 3-D reconstruction framework; Auto-calibration.

Feature Extraction: Edges - Canny, LOG, DOG; Line detectors (Hough Transform), Corners - Harris and Hessian Affine, Orientation Histogram, SIFT, HOG, Scale-Space Analysis- Image Pyramids and Gaussian derivative filters, Gabor Filters and DWT.

Pattern Analysis: Clustering: K-Means, Mixture of Gaussians, Classification: Discriminant Function, Supervised, Un-supervised, Semi-supervised; Classifiers: Bayes, KNN, ANN models; Dimensionality Reduction: PCA, LDA, ICA.

Motion Analysis: Background Subtraction and Modeling, Optical Flow, KLT, Spatio-Temporal Analysis, Dynamic Stereo; Motion parameter estimation.

Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

8ITU03.2ADVANCE OPERATING SYSTEMS

MAX_MARKS(50+100)

Objectives: This course aims at defining the basic architecture of operating systems, architecture of distributed operating systems, different types of clock synchronization methods and their limitations, mutual exclusion algorithms and deadlock models, understanding various file system managementand challenges in an operating system,different load sharing and load distribution algorithms.

Syllabus:

Operating system introduction and structure, processes, threads, interprocess communication.cpu scheduling: Scheduling algorithm, multiprocess and realtime process scheduling, algorithm evaluation. Process synchronizations: semaphores, critical regions and monitors.

Distributed OS: architecture of distributed Systems, issues in DOS, client-server computing, message-passing, remote procedure call (RPC), limitations of DS, absence of shared memory and global clock, lamport's Logical clocks, vector clocks, causal ordering of messages.

Distributed mutual exclusion and deadlock: mutual exclusion algorithms, token-based and non-token-based algorithms, deadlock models and algorithms, deadlock detection and prevention. Distributed file systems and shared memory: architecture of distributed file systems, design issues, replication algorithms, cache coherence.

Distributed scheduling: motivation and issues, load distribution, balancing and sharing algorithms, load distribution algorithms, load scheduler, task migration.

Failure recovery and fault tolerance: introduction and basic concepts, classification of failures, backward and forward recovery, check pointing and recovery, issues in fault tolerance, commit and voting protocols.

Real-time OS: characteristics of real time OS, hard versus soft real-time systems, real-time communications, real-time scheduling, case study: windows CE, palm OS.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

8ITU03.3 WIRELESS SENSOR NETWORKS

MAX_MARKS(50+100)

Objectives:

This course aims to cover the basic principles behind a Wireless Sensor Network. It provides a broad coverage of challenges and latest issues related to the design and management of WSN and aspects like protocols and their applications.

Syllabus:

Overview of Wireless Sensor Networks: Characteristics, Applications, Design objectives, challenges. Technological Background – MEMS Technology, Hardware and Software Platforms, Wireless Sensor Network Standards. Sensor network architectures and protocol stack.

MAC protocols: Fundamentals, low duty cycle protocols and wakeup concepts, contention based protocols, Schedule-based protocols - SMAC, BMAC,TRAMA, Link Layer protocols.
Sensor Deployment Mechanisms, Issues of coverage, Node discovery protocols, Localization schemes, Time Synchronization, Network clustering, Query Models, In-network data aggregation, Robust route setup, Coping with energy constraints, QoS Management, Security.

Routing protocols: Issues in designing a routing protocol, classification of routing, Requirements, Taxonomy - Data-centric routing – SPIN, Directed Diffusion, Flooding and gossiping, Energy aware routing, Gradient-based routing – COUGAR, Hierarchical Routing – LEACH, TEEN,APTEEN, Location Based Routing, Data aggregation – Various aggregation techniques, Localization and positioning.

Research areas in wireless sensor networks: Current and future research on WSNs.

Admission Year (AY)	2015-16	2016-17	2017-18	2018-19	
Scheme Code (SC)	2015IT	2016IT	2017IT	2017IT	

Scheme Code – 2015IT

8ITU07 PATTERN RECOGNITION LAB

MAX_MARKS(50+25)

Objective: After taking this course students will be able to design and implement supervised and unsupervised pattern classifiers. They will be able to visualize and analyse, patterns in data sets from different domains.

List of Experiments:

1. Implement and analyze different distance functions and similarity measures.
2. Implement nearest neighbour classifier.
3. Implement Bayes classifier: Covariance matrix for all the classes is the same.
4. Implement Bayes classifier: Covariance matrix for each class is different.
5. Implement Naive Bayes classifier.
6. Implement K-means clustering algorithm.
7. Implement K Mediodsclustering algorithm.
8. Implement Hidden Markov Models.
9. Implement Support Vector Machine.
10. Implement Fuzzy pattern classifier.

Note: Students will be provided with adequate data sets by the instructor to complete the lab assignments.

Scheme Code – 2015IT

8ITU08 BIG DATA USING HADOOP LAB

MAX_MARKS(50+25)

Objectives: This course aims at introducing Java concepts required for developing map reduce programs, impart the architectural concepts of Hadoop and introducing map reduce paradigm and introduce programming tools PIG & HIVE in Hadoop echo system.

List of Experiments:

1. Implement the following Data structures in Java

   i) Linked Lists ii) Stacks iii) Queues iv) Set   v) Map

2. Perform setting up and Installing Hadoop in its three operating modes: Standalone, Pseudo distributed, Fully distributed.

3. Implement the following file management tasks in Hadoop:

- Adding files and directories
- Retrieving files
- Deleting files Hint: A typical Hadoop workflow creates data files (such as log files) elsewhere and copies them into HDFS using one of the above command line utilities.

4. Run a basic Word Count Map Reduce program to understand Map Reduce Paradigm.

5. Write a Map Reduce program that mines weather data. Weather sensors collecting data every hour at many locations across the globe gather a large volume of log data, which is a good candidate for analysis with MapReduce, since it is semi structured and record-oriented.

6. Implement Matrix Multiplication with Hadoop Map Reduce

7. Install and Run Pig then write Pig Latin scripts to sort, group, join, project, and filter your data.

8. Install and Run Hive then use Hive to create, alter, and drop databases, tables, views, functions, andindexes.

9. Solve some real life big data problems.
